Identifiers: *Injunctive relief, *National Environmental Policy Act, *Burden of proof, *Environmental impact statement, *Tallahatchie and Yalobusha Counties(Miss).

An action was brought in the United States District Court for northern Mississippi seeking to enjoin a proposed drainage project. The court held that in determining the sufficiency of the environmental impact statement and further compliance with the National Environmental Policy Act, the burden of proof is on the plaintiffs to prove by a preponderance of the evidence that the defendents failed to adhere to the requirements. The National Environmental Policy Act sets standards of limited review of substantive ecological decisions made by federal agencies under the Administrative Procedure Act. In light of substantial reasons for proceeding with the drainage district project, the court could not substitute its judgement for that of federal authorities legally authorized to design and implement the project. No evidence was offered to show that the federal agency acted arbitrarily or irrationally in recommending the project. (Sperling-Florida)

MARINE TOWING, INC. V. RED STAR TOWING AND TRANSPORTATION CO. (ACTION FOR DAMAGES SUFFERED WHEN TUG STRUCK A WRECK IN NAVIGABLE WATERS).
381 F Supp 619 (E D New York 1973).

Descriptors: *New York, *Judicial decisions, *Boating regulations, Legal aspects, Boats, Harbors, Negligence, Remedies, Damages, State jurisdiction, Safety, Water law, Hazards, Accidents.
Identifiers: *Statutes.

An admiralty action was brought in federal District Court by a tugboat owner for damages suffered when it struck a wreck. The court held the Coast Guard's placing of a flag and lantern on the mast and direction of ships around the wreck did not relieve the wreckowner of its duties under the Wreck Statute. The owner was held in violation of the statute for failing to keep watch until the Coast Guard had marked the wreck with a more permanent buoy. In addition, the court found that where both the tugboat owner and the owner of the wreck were negligent each was liable for half of the damage. (Sperling-Florida)

PROBLEMS OF SCALE AND DETAIL IN ECOLOGICAL MODELLING,
Utah State Univ., Logan. Ecology Center
D. W. Goodall
Journal of Environmental Management, Vol 2, No 2, p 149-157, April 1974. 1 ref.

Descriptors: *Model studies, *Ecosystems, Dynamics, *Ecology.
Identifiers: *Ecosystem models, Niche structure.

The importance of niche structure in ecosystem dynamics is emphasized. This implies that an ecosystem model which ignores species differences runs the rish of neglecting important elements in its dynamics. Unless circumstances permit direct comparison of a simplified model with the observed behavior of a representative range of eco systems, it is recommended that acceptance of the simplified model be based on a demonstration that deviations from the behavior of an alternative model taking biological diversity fully into account are negligible for the purposes in question. Spatial heterogeneity, like biological diversity, may contribute greatly to the dynamics of an ecosystem, and a simplified model which ignores it should be accepted only if justified either by an empirical test or by a comparison with a more complex model taking the heterogeneity into account. Identifiers: *Man-made islands, *Floating structures, *Coastal Zone Management Act.

Man-made islands may be divided into four categories differentiated on the basis of their construction: floating structures maintained in a fixed position by attachment to the ocean floor; structures fixed on sea floor by means of caisson-like tubes sunk into the bottom; concrete structures; and islands created by the dumping of natural materials, such as rock and gravel. Environmental objections have been raised regarding such man-made islands, with particular focus on oil related structures. National and international pollution laws which pertain to man-made islands are summarized. Special attention is directed towards oil drilling platforms and superports, constructed and operated by the United States or its citizens. Legislation explored includes the Federal Water Pollution Control Act Amendments of 1972; the Rivers and Harbors Act of 1899; the Outer Continental Shelf Lands Act; the Ports and Waterways Safety Act of 1972; Coastal Zone Management Act of 1972; the National Environmental Policy Act of 1969; Marine Protection, Research, and Sanctuaries Act of 1972; and the proposed Deepwater Port Act. In addition, an analysis of pertinent international law is presented. (See also W76-00963) (Hoffman-Florida)

LEGAL ASPECTS OF PHOSPHATE MINING IN NORTH CAROLINA,
North Carolina State Univ., Raleigh.
M. A. Almond.
Sea Grant Publication UNC-SG-75-05, February, 1975. 29 p, 167 ref, append.

Descriptors: *North Carolina, *Phosphates, *Mining, *Environmental effects, Dreding, Excavation, Exploitation, Exploration, Underground structures, Balance of nature, Ecology, Aquatic habitats, Eutrophication, Regulations, Remedies, Land reclamation, Groundwater, Air pollution, Fertilizers, Minerology.
Identifiers: Underwater mining, Phosphate mining.

The removal of phosphates from beneath navigable waters in North Carolina may produce adverse effects upon marine life adjacent to the operation. On the other hand, the phosphate is critically needed to provide fertilizer to increase crop yields in a hungry world. The pertinent state statutes and legal thinking likely to be used in the administrative or legal solution of this problem are analyzed. The on-land phosphate mining process can cause environmental problems in three areas: air pollution, land reclamation, and groundwater. Underwater mining could also cause major problems, such as salt water intrusion, eutrophication, and ir-

LIBRARY U. OF I. URBANA-CHAMPAIGN

reparable damage to the state's shrimp industry. Several legal remedies are explored that might insure that the future development of phosphate mining is consistent with the preservation of estuarine resources. These remedies are governmental regulations, private remedies, contractual remedies, and the good faith of the mining industry. Any such solutions must depend in large part on the presence and spirit of one corporation, Texasgulf, Inc.; mainly because Texasgulf is at present the only company mining phosphate in the state. (Hoffman-Florida)

TRANSACTIONS OF THE THIRTY-EIGHTH NORTH AMERICAN WILDLIFE AND NATURAL RESOURCES CONFERENCE, WASHINGTON, D.C., MARCH 18-21, 1973.
Wildlife Management Institute: Washington, D.C., 1973, 525 p, Illus, Maps.

Descriptors: *Priorities, *Natural resources, Human Population, Oil shales, Conferences.
Identifiers: Coastal zone.

This volume contains papers on various aspects of natural resources and national priorities. Part 1 discusses actions needed to benefit resources and people, covering such topics as science and society in the age of environment and impact of population growth on resources and the environment. The status and needs of rare and endangered species is discussed including such topics as dwindling and endangered ungulates of Chile and comparative productivity of 5 bald eagle populations. A section on planning for intensive resource management covers Canada's inventory of land-wildlife capabilities and political economy of water resources development. Balancing human, wildlife and fish needs are discussed in relation to such topics as restricting human use of public lands in North America and environmental planning for oil shale production in western Colorado, USA. The final section, priorities in resource management, discusses balancing demands for natural resources, federal organization to meet resource needs and a progress report on coastal zone management. Lists of literature cited as well as discussion accompanies the contributed papers. Individual papers are indexed in BIORESEARCH INDEX.--Copyright 1974, Biological Abstracts, Inc.

HYDROLOGIC DATA NETWORK FOR THE OSWEGO RIVER BASIN, NEW YORK,
Geological Survey, Albany, N. Y.
J. M. Whipple, and K. I. Darmer.
Administrative Report, September 1975. 64 p, 3 fig, 2 plate, 8 tab, 46 ref, append.

Descriptors: *Hydrologic data, *Network design, *Data transmission, *Satellites(Artificial), *New York, River basins, Water quality, Streamflow, Lakes, Water levels, Runoff, Flood forecasting, Planning, Methodology, Remote sensing, Telometry.
Identifiers: *Oswego River basin(NY), Real-time data.

Data from proposed ultimate real-time data network of 17 precipitation gages, 33 stream- flow stations, and 11 lake-stage stations would be transmitted to a central location for use in flood forecasting and in providing for optimum use of the water resources of the Oswego River basin in New York. A three-phase implementation of the network is proposed to provide (1) new data-collection stations, (2) perfection of transmission of data by satellite, and (3) ultimate conversion to a real-time data system. APPLICATION OF MICROWAVE WATER SENSING TECHNIQUES TO WATERSHEDS,
Montana State Univ., Bozeman. Dept. of Electrical Engineering.
B. R. McLeod.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-246 196, $3.75 in paper copy, $2.25 in microfiche. Research Report No 67, Montana University Joint Water Resources Research Center, Bozeman, July 1975. 35 p, 8 fig, 9 tab, 2 ref. OWRT A-079-MONT(1).

Descriptors: *Instrumentation, *Moisture meters, *Electronic equipment, *Microwaves, *Watershed management, Measurement, *Moisture content, Humidity, Litter, *Forests watersheds.
Identifiers: *Microwave meters, Forestry instrumentation.

The feasibility of applying microwave moisture sensing techniques to the area of watershed management is discussed. A portable, field-usable microwave meter was developed to given rapid, accurate moisture information on such forest fuels as litter, duff, and dead sticks between 1/4 and 1/2 inch in diameter. The meter weighs 23 pounds, is powered by two rechargeable batteris, and is packaged in a small fiberglass case that insures the meter will operate in a field environment such as a fire camp. The unit has been field-tested for three years with the final year's data being used to calibrate the meter. The project also produced a second type of meter using the same principle of microwave moisture sensing. This instrument monitors, on a real-time basis, changes in forest fuel moisture content in response to changes
ternal stimuli such as humidity changes. Prel
ry results show very rapid changes in m
content for litter as compared to presen
cepted numbers for the time rate of change
moisture content of litter. (Holje-Montana S

tory study was made of the performance
' Array' humidity sensors over a range of
emperature from -40 to + or -20C encom-
relative humidities from 0 to 90%. The
turer categorized this sensor as a solid-
niconductor device comprising a 'precise
crystals and interstitial spaces.' It was
within a slotted TO-5 transistor enclo-
excitation oscillator, driven by a dc input
s, provided a 5-volt rms 1000-Hz signal to
r and a demodulator provided a dc output
rying in magnitude from 0 to 5 volts. This
was measured with a digital voltmeter
l to within + or -0.3 mV or less for all
nents reported. Each of two excitation
s was connected through appropriate ca-
ve sensors and demodulators. There was
iability in the set of ten sensors used in
. The sensitivity of individual sensors
a factor of at least three. There was con-
ambient temperature effect, so that each
d to be calibrated according to the tem-
range of the intended use. Sensors were
eful at low temperatures or low relative
s as at higher temperatures and relative
s. (Roberts-ISWS)

Identifiers: Hancock County(Ind).

Potential yield from groundwater supplies in Hancock County, Indiana, were plotted on a large scale map (1 inch=1 mile). Other related information was presented on the reverse side of the map. Data on the geography, population, climate, surface water, water quality, and geology of the county were included. The three existing public water supplies in Hancock County were described. THE SURFACE WATER SUPPLY OF THE UNITED STATES, 1966-70: PART 4. ST. LAWRENCE RIVER BASIN--VOLUME 1. BASINS OF STREAMS TRIBUTARY TO LAKES SUPERIOR, MICHIGAN, AND HURON,.
Geological Survey, Reston Va.
Available from Supt. of Documents, GPO, Wash. D.C. 20402, price $5.10 Geological Survey Water-Supply Paper 2111, 1974. 754 p, 1 fig.

Descriptors: *Basic data collections, *Surface waters, *Streamflow, *Flow rates, *St. Lawrence River, River basins, Lake Superior, Lake Michigan, Lake Huron, Discharge(Water), Gaging stations, Flow measurement, Average flow, Water levels, Lakes, Reservoirs, Hydrologic data.
Identifiers: Maximum discharges, Minimum discharges.

This report is one of a series of 37 reports presenting records of stage and discharge of streams, and of stage and contents of lakes and reservoirs in the United States during the 1966-70 water years; it contains the records for gaging stations and partial-record stations in the St. Lawrence River basin, streams tributary to Lakes Superior, Michigan, and Huron. This is one of the second series of water-supply papers to be published on a 5-year basis. The first series covered the 5-year period October 1, 1960, to September 30, 1965. This series covers the period October 1, 1965, to September 30, 1970. The daily table for stream-gaging stations gives the mean discharge for each day and is followed by monthly and yearly summaries of total, average, maximum, and minimum discharges. (Woodard-USGS)

GROUND-WATER LEVELS IN THE UNITED STATES, 1969-73: SOUTH-EASTERN STATES.
Geological Survey, Reston, Va.
Available from Supt. of Documents, GPO, Wash., D.C. 20420, price $2.45. Water-Supply Paper 2171, 1975. 250 p, 12 fig, 3 ref.

Descriptors: *Basic data collections, *Groundwater, *Water wells, *Water levels, *Southeast U. S., Observation wells, Hydrologic data, Alabama, Florida, Georgia, Kentucky Maryland, Mississippi, North Carolina, South Carolina, Tennessee, Virginia, West Virginai, Aquifers, Water utilization, Groundwater resources.

Five years (1969-73) of water-level measurements in 11 states in southeastern United States are given in feet with reference to either mean sea level or land-surface datum. Mean sea level is the datum plane on which the national network of precise levels is based; land-surface datum is a datum plane that is approximately at land surface at each well. If known, the altitude of the land-surface datum above mean sea level is given in the well description. The height of the measuring point above or below land-surface datum is given in each well description. Water levels in wells equipped with recording gages are reported for every fifth day and the end of each month. (Woodard-USGS)

GROUND-WATER BASIC DATA FOR GRANT AND SIOUX COUNTIES, NORTH DAKOTA,
Geological Survey, Bismarck, N. DAK.
P. G. Randich.
North Dakota, Geological Survey, Bismarck, County Ground-Water Studies 24--Part II, and North Dakota Geological Survey Bulletin 67--Part II, 1975. 303 p, 2 fig, 1 plate, 8 tab, 23 ref, append.

Descriptors: *Basic data collections, *Groundwater resources, *Water quality, *Lithologic logs, *North Dakota, Water wells, Well data, Aquifer characteristics, Hydrogeology, Water levels, Groundwater recharge, Streamflow, Low flow, Chemical analysis, Particle size.
Identifiers: *Grant County(ND), *Sioux County(ND).

Groundwater data for Grant and Sioux Counties, N. D., were collected chiefly between 1971 and 1974. The data include: (1) Geologic and hydrologic records for 1,610 wells and test holes; (2) water-level measurements in 77 observation wells; (3) lithologic and geophysical logs of 257 test holes and wells; (4) 135 chemical analyses of groundwater; (5) 15 chemical analyses of water from streams during low flow; (6) 13 chemical analyses of minor elements in water from wells; (7) 30 particle-size distribution graphs; and (8) 30 analyses of core samples for hydraulic parameters and heavy mineral content. LIBRARY U. OF I. URBANA-CHAMPAIGN

For sale by USGS, Reston, Va 22090, price $0.75. Miscellaneous Investigations Services Map I-857 C, 1975. 1 sheet, 1 map, 9 ref.

Descriptors: *Flood plains, *Maps, *Urbanization, *Flood protection, *Colorado, Flood frequency, Land development, Land use, Streamflow, Flow characteristics, Hydrologic data, Flood plain zoning, Watershed management.
Identifiers: *Colorado Springs(Colo), *Castle Rock area(Colo).

The rapid growth of population in the Front Range Urban Corridor of Colorado is causing intense competition for available land resources. One form of competition posing serious problems is unregulated development along natural watercourses. This map depicts a broad-scale view of flood-prone areas along principal streams in the Colorado Springs-Castle Rock area of the urban corridor. Flood-prone areas identified are subject to inundation by the 100-year flood, a flood having a 1 percent change of being equaled or exceeded in any given year. The magnitude and depth of the reference flood were derived for streams in the study area from streamflow records and reports of the U.S. Geological Survey and from reports of the U. S. Army Corps of Engineers. (Woodard-USGS)

Descriptors: *Hydrologic data, *Maps, *Surface waters, *Groundwater, *Colorado, Sites, Climatic data, Streamflow, Water quality, Publications, Information retrieval, Watershed management, Planning, Urbanization.
Identifiers: *Colorado Springs, *Castle Rock area(Colo).

This map shows by symbols and color the hydrologic data published as of January 1974 for the Colorado Springs-Castle Rock Colo., area by the U.S. Environmental Data Service and by the U.S. Geological Survey and cooperating agencies. All sources of the data are given in the references and are referred to in the discussion. Of the 44 climatological stations shown the longest precipitation records are for Fountain, Colo., beginning in 1866. Colorado Springs' precipitation records begin in 1871. Surface-water data include continuous records of stage and discharge of streams. Location of 16 surface-water data sites are shown; included are 7 continuous-record stream-stage and discharge stations, and 4 staff-gage stream discharge sites. Streamflow records were collected as early as 1908. Groundwater data sites plotted on the map represent 40 wells where water levels have been measured periodically for 4 or more years or monthly for at least 1 year, and 49 wells from which water samples have been analyzed for dissolved-chemical constituents. C ISLAND...TEN YEARS AFTER,
Collins and Associates Ltd., Honolulu, i.
lance, and P. M. Hirota.
and Beach, Vol. 42, No. 2, p 19-22, October fig, 8 ref.

ptors: *Islands, *Waves(Water), *Beaches, on, *Breakwaters, *Circulation, *Hawaii, ns, Sea walls, Construction, Design criteria, mance.
iers: *Peninsula, *Magic Island, *Swells, .

itial plan for constructing an island on the le reef in front of Honolulu's Ala Moana Park, and the work already performed were described. Only Ala Wai peninsula, a rubble mound breakwater fronting it, and two artificial beaches were completed. Environmental and public opposition halted the project and the island, called 'Magic Island' was not constructed. A detailed discussion was presented of the design criteria used for breakwater structures, considering wave run-up, wave heights and periods, slopes of the breakwater, and sizes of the stones used in the breakwater. The performance of the breakwater in the last 10 years was also explored. Overtopping of the breakwaters due to unusual smoothness of the breakwater front slope and subsequent erosion on the east side of the lagoon were reported. Presence of wind wave erosion was also noted on the west end of the lagoon beach. Parts of the lagoon beach have stablized on a slope of about 1:10. Despite these problems, the lagoon beach, seawall, and breakwater continue to function essentially as they were intended. (Bhowmik-ISWS)

MAINTENANCE OF TARRYTOWN HARBOR, NEW YORK, NAVIGATION PROJECT (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, New York.
Available from the National Technical Information Service, Springfield, Va 22161, as EIS-NY-73-1829-F, $4.00 in paper copy, $2.25 in microfiche. November 26, 1973. 43 p, 2 fig, 1 tab.

Descriptors: *Benthic fauna, *Dredging, *Channel improvement, *Channels, *Dimensions, Depth, Turbidity, Environmental effects, New York, Water quality.
Identifiers: *Environmental Impact statements, *Tarrytown, N.Y.

The project involves a maintenance activity consisting of dredging the existing federal navigation channel in Tarrytown Harbor, New York, to its authorized project dimensions. The spoil will be deposited in the Atlantic Ocean. Implementation will facilitate effectual and safe delivery by water of petroleum products and automobile parts to a densely populated region. The dredging will affect water quality and cause temporary turbidity. Benthic life will also be affected through the removal of bottom materials. Alternatives considered include alternative methods of spoil disposal or no maintenance. (Denvir-Florida)
W76-00940

FLOOD CONTROL ON SAGINAW RIVER, MICHIGAN AND TRIBUTARIES, FLINT RIVER AT FLINT, SWARTZ AND THREAD CREEKS, SECTIONS C-1 AND D, MICHIGAN (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Detroit, Mich.
Available from the National Technical Information Service, Springfield, Va 22161 as EIS-MI-73-0523-F, $6.00 paper copy, $2.25 microfiche. March 1973, 150 p, 33 fig, 6 plat.

Descriptors: *Flood control, *Flood protection, *Channel improvement, Flood stages, Stream flow, Michigan, Environmental effects, Floods, Trees, Brush, Streams, Channels, Flooding, Storage, Tributaries, Water quality.
Identifiers: *Environmental impact statements, *Flint River, Michigan, Contiguous zone.

The project involves Flint River, Michigan, flood control improvements authorized by the Flood Control Act of 1958. The project consists of channel realignments and modification of 11,000 feet of the main stem of the Flint River and 8,900 feet of its tributaries. The program contemplates construction of a concrete-lined channel and concrete floodwalls for the river and an improved earth channel with raised levels along certain sections of the tributaries. The completed project will provide flood protection for approximately 455 acres of land adjacent to the Flint River and its tributaries. This area, subject to periodic flooding, includes a concentrated industrial complex. The proposed action would have an adverse environmental impact upon the existing stream channesl and the immediate, contiguous areas by displacing biological communities through the excavations and the construction of the concrete channel. The flood protection plan would remove trees and brush along the creek, and also reduce park space through channel enlargements. Alternatives to the proposed action include reduction of the flood stage design; reliance on non-structural techniques; utilization of upstream storage sites to reduce flood stages at the Flint problem areas; and discontinuance of the project. (Gagliardi-Florida)
W76-00941

REPLACEMENT OF LOCK AND DAM 7 AND LOCK 8, MONONGAHELA RIVER PENNSYLVANIA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Pittsburgh, Pa.
Available from the National Technical Information Service, Springfield, Va 22161 as EIS-PA-73-1694-F, $3.50 in paper copy, $2.25 in microfiche. October 1973, 19 p, 3 map.

Descriptors: *Environmental effects, *Navigation, *Dam construction, *Locks, Dams, Pennsylvania, Rivers, Navigable rivers, Navigable waters, Water utilization, Water users, Dredging, Construction, Turbidity, Sediments, Sediment distribution.
Identifiers: *Environmental impact statements, *Fayette and Greene Counties(Pa), Dam effects.

The project involves the complete replacement of existing river navigation facilities at Lock and Dam 7 and Lock 8, Monongahela River, Fayette and Green Counties, Pennsylvania. The improvement of navigation facilities will provide measures and incentives for continuation of growth in development and expansion of waterway user industries. An environmental effect of the project will be a pool level increase of 15 feet, extending 2.8 miles from river mile 82.2 to 85.0. It is predicted that the primary adverse environmental impact will be related to construction activities resulting in increase turbidity and sediment deposits for a relatively short river reach downstream of the project facility. Alternatives suggested include: replacement of Lock and Dam 7 at locations other than the site chosen, changes in the level of pool, or no action at all. Comments have been received from the United States Bureau of Sports Fisheries and Wildlife and Federal Water Quality Administration and from Pennsylvania's Department of Environmental Resources. (Gagliardi-Florida)
W76-00943

COLUMBIA AND LOWER WILLAMETTE RIVERS BELOW VANCOUVER, WASHINGTON AND PORTLAND, OREGON, SLAUGHTERS BAR REACH (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Portland, Oreg.
Available from the National Technical Information Service, Springfield, Va 22161 as EIS-OR-73-1123-F $5.00 in paper copy, $2.25 in microfiche. December 15, 1972, 82 p, 12 fig.

Descriptors: *Channel improvement, *Basins, *Dredging, *Columbia River, Spoil banks, Environmental effects, Environment, Navigation, Channels, Rivers, Sediments, Habitats, Turbidity, Disposal, Fish, Wildlife habitats, Shoals, Washington, Oregon.
Identifiers: *Environmental impact statements, *Portland(Ore).

The project involves plans to continue construction of a 40-foot-deep by 600-foot-wide navigation channel at Slaughters Bar, and a 40-foot-deep by 1200-foot-wide, turning basin above the Longview Bridge. The project also entails plans to dispose of

LIBRARY U. OF I. URBANA-CHAMPAIGN

dredge material on Cord Island, Oregon and Washington shores, with maintenance spoils being placed on Howard Island and the Oregon shore. The primary environmental impact of the project will be removal from the Columbia River of approximately 3.6 million cubic yards initially and 450,000 cubic yards annually of river bottom sediments. The adverse environmental effects will entail temporary increases in turbidity adjacent to and downstream of disposal areas and the temporary elimination of some wildlife and fish habitat. The secondary impacts associated with future industrialization will reduce and/or eliminate wildlife habitat on parts of the Oregon shore disposal area. Alternative proposal include: alternative plans for providing authorized channel and turning basin dimensions with provisions for reducing shoaling in the Slaughters Bar Reach; alternative disposal sites and uses of dredged materials; and no action. (Gagliardi-Florida)
W76-00944

PERMITS FOR ACTIVITIES IN NAVIGABLE WATERS OR OCEAN WATERS.
Federal Register, Vol 40, No 88, p 19766-19798, May 6, 1975.

Descriptors: *Dredging, *Permits, *Navigable waters, *Landfills, *Non-navigable waters, *Rivers and Harbors Act, Administration, United States, Legislation, Regulation, Administrative agencies, Artificial water courses, District of Columbia, Drainage, Erosion, Elevation, Swamps, Coastal plains, Coastal marshes, Inland waterways, Land forming, Mixing, Disposal, Specifications, Adoption of practices.
Identifiers: *Army Corps of Engineers, Disposal areas, Mixing zone, Administrative regulations.

Pursuant to the order of the U.S. District Court for the District of Columbia in NRDC v. Callaway, Civil Action No. 74-1242 (D. C. D. C. March 27, 1975), The Secretary of the Army herein proposes certain regulations to supersede those in 33CFR 209.120. All of the proposed changes pertain to the disposal of the dredged or fill material in water, or on land if the material might be worked back into water. They govern the procedures to be followed by the Corps of Engineers in requiring a Department of the Army permit for the water disposal of dredged material in every body of natural and artificial water in the U.S., and limting the types of waters for which a permit for dredging activities would be required. Public comment is invited on four different alternative regulations proposed. Appendices to the proposed rules include a statement of coordination and cooperation between the Secretaries of the Army and the Interior in regulating dredging activities, and guidelines for the delegation of authority in the issuing of permits. Proposed Part 230 covers other dredging related topics such as evaluation procedures, testing requirements, requirements for disposal sites, contaminated fill restrictions, and rules for the recording of disposal sites. (Parrish-Florida)
W76-00945

BLOUNT ISLAND DEVELOPMENT, JACKSONVILLE, FLORIDA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Jacksonville, Fla.
Available from the National Technical Information Service, Springfield, Va 22161 as EIS-FL-73-1292-F, $12.75 in paper copy, $2.25 in microfiche. August 3, 1973, 511 p.

Descriptors: *Bulkheads, *Dredging, *Industrial plants, Turbidity, Disposal, Weirs, Embankments, Grading, Environmental effects, Florida, Dikes, Road banks, Industries, Industrial production, Rivers.
Identifiers: *Environmental Impact Statements, *Jacksville(Fla).

The proposed action would authorize construction of a bulkhead and dredging operation in the St. Johns and Back River, Florida; placement of fill on upland and Back River sites; and grading and related operations in the vicinity of Blount Island. The purpose of the dredge and fill is to modify 950 acres of Blount Island, including 275 acres of Back River, for industrial development. Potential environmental impacts associated with the project are considered to be minimal. The impact on the surrounding community of an increase of 10,000 to 12,000 additional jobs resulting from the facility will be gradual. An adverse environmental effect will be the loss of whatever present and future contribution the 275 acres of Back River has to the total biological productivity of the St. Johns River Biologists are in disagreement as to the magnitude and significance of that loss. There will also be a temporary increase in turbidity in the waters of the St. Johns River in the local vicinity of the dredging and disposal operations. The planned use and maintenance of weirs, dikes, and containment booms will limit the degree and extent of that increase. The alternatives to the proposed action are to maintain the status quo and select a different site for the proposed facility; rezone the area to preserve the remainder of Blount Island; or utilize the remainder of Blount Island for continued fill placement and preserve Back River and its tidally inundated marsh fringes. (Gagliardi-Florida)
W76-00957

MARBLE BLUFF DAM AND PYRAMID LAKE FISHWAY, WASHOE PROJECT, NEVADA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Bureau of Reclamation, Sacramento, Calif. Mid-Pacific Regional Office.
Available from the National Technical Information Service, Springfield, Va 22161 as EIS-NV-73-1585-F, $5.00 in paper copy, $2.25 in microfiche. October 4, 1973, 78 p, 6 fig.

Descriptors: *Dams, *Fisheries, *Erosion, Environmental effects, Nevada, Erosion control, Dam construction, Dam design, Fish, Fish management, Channels, Farms, Hatching, Recreation, Recreation demand.
Identifiers: *Pyramid Lake Indian Reservation, Nevada, *Environmental Impact Statements, Wilderness areas.

The project entails the construction and operation of a dam, fishway and related fish handling facilities near the terminus of the Truckee River in the Pyramid Lake Indian Reservation in Nevada. The dam will reduce river headcutting in the channel area preventing continued and extensive erosion of adjacent farmlands. The project's chief beneficial environmental impact will be the improvement of Pyramid Lake as a fishery and the preservation of Indian agricultural lands and homesites along the lower Truckee River. Construction roads, supporting structures and yards, noise and dust will have temporary adverse effects. Marble Bluff Dam and associated structures will intrude on the level, barren landscape. However, the structures are not large nor unharmonious with the surroundings. Disturbance of the natural setting should therefore be moderate. Improvement of the fishery will bring about increased recreational usage of the lake and adjacent shore areas. Possible alternatives include fishery restoration by hatchery production, a river channel modification in lieu of the proposed dam, and construction at an upstream damsite. Comments have been received from the Departments of Interior, Army, Agriculture, and Commerce among others. (Gagliardi-Florida)

getown Creek Watershed, Bear Lake Coun-

The proposed project entails land treatment measures, channel work, and improvements to the irrigation distribution system of the Georgetown Creek Watershed, Bear Lake County, Idaho. The project will provide waterhsed protection, flood prevention, and facilitation of irrigation. The environmental impact and effects of the project include erosion; floodwater and sediment damage reduction; improvement of water quality; elimination of various health hazards; stimulation of improved economic return; and a temporary loss of fish habitat and a decline of water quality due to construction activities. Alternatives considered include utilization of reservoirs for water storage and control; modification of the proposed works to provide a minimum flow of five cubic feet per second to maintain a fishery between the existing and proposed points of diversion or no action. (Gagliardi-Florida)

HAYS, KANSAS, FLOOD PROTECTION PROJECT (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Kansas City, Mo.
Available from the National Technical Information Service, Springfield Va 22161 as EIS-KS-73-0762-F $4.50 in paper copy and $2.25 in microfiche. November 1972. 63 p, 16 fig, 5 tab.

Descriptors: *Levees, *Channels, *Flood protection, *Flood control, Flood plain zoning, Environmental effects, Habitats, Biota, Kansas, Flood plains, Fisheries.
Identifiers: *Environmental Impact Statements, *Hays(Kan).

The recommended plan consists of new levees, raising of existing levees, and some channel work to provide protection from 76 percent of the standard project flood on Big Creek, Hays, Kansas. The project will provide flood protection to the already existing development in the flood plain, but it will destroy the existing channel and stream habitat to some extent. This includes the loss of associated stream biota that, in large part, supports its existing fishery. The project will also disrupt the existing character of the park. Alternatives to the proposed action include flood plain evacuation and zoning, flood control lake, or no action. Other alternatives considered related to utilization of Lincoln Draw, another channel. (Denvir-Florida)

SHEAR DISTRIBUTION IN BENDS IN RECTANGULAR CHANNELS,
Uttar Pradesh Irrigation Research Inst., Roorkee (India).
D. V. Varshney, and R. J. Garde.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY8, Paper 11513, p 1053-1066, August 1975. 7 fig, 2 tab, 6 ref, 2 append.

Descriptors: *Open channel flow, *Laboratory tests, *Shear stress, Flumes, Velocity, Reynolds number, Continuity equation, Analysis, Distribution patterns, Hydraulics, Curves, Flow resistance, Roughness(Hydraulic).
Identifiers: *Bends, Secondary flow.

The analysis was based on a forced vortex velocity distribution near the exit of the bend. The constant is the assumed mean velocity distribution was evaluated by use of the continuity equation and by assuming that the entire superelevation had died out at the exit section. The exponent on the radius in the velocity distribution equation was correlated with the bend geometry and the Reynolds number. The mean velocity relationship suggested by Keulegan was assumed to be valid for flow in a bend. Experimental data, collected in a bend in a rectangular flume, were used along with other data to obtain information on the velocity variation. The flume bend had a 60 degree central angle. Three bed roughnesses were used. The bend radius to flume width ratio varied between 1.5 and 6.0. Bed shear stresses were measured in the bend with a preston tube calibrated for each bed roughness. M. Sami Selim, and D. Kirkham.
Water Resources Research, Vol 10, No 5, p 1019-1030, October, 1974. 19 fig, 3 tab, 19 ref.

Descriptors: *Well screen, *Wells, Theoretical analysis, Hydraulic design, Hydraulic equipment, Hydraulic properties, Irrigation wells.
Identifiers: *Screen theory.

A theoretical solution is given for steady flow in a confined aquifer to a well tube having equally distributed screens. It is shown, quantitatively, by use of Darcy's law and Laplace's equation, that more flow results if a given total length of well screen is utilized in a number of sections over the full length of the well tube than if the given length of well screen is all used at the bottom of the tube. For a pumped well of 0.25-ft radius, 200-ft radius of influence, 50-ft thickness of aquifer, and 25-ft length of screen the use of the screen in five 5-ft-long sections equally distributed over the well tube results in 25% more well flow than if the 25-ft length of screen is all in one piece at the lower 25 ft of the aquifer. The results are presented in tables and graphs having dimensionless parameters so that the flow for a particular flow system may be found in any units. Mathematically, the problem is of the mixed boundary value type. (Skogerboe-Colorado State)

R. B. Darden, J., Imberger, and H. B. Fischer.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 101, No. HY9, Proceedings Paper 11583, p 1211-1220, September 1975. 9 fig, 2 tab, 10 ref, 2 append. NSF GI 34932, EPA 15040 EJZ.

Descriptors: *Jets, *Stratified flow, *Thermal stratification, *Unsteady flow, *Flow profiles, Hydraulics, Reservoirs, Density, Dispersion, Laboratory tests, Circulation, Discharge(Water), Buoyancy.
Identifiers: Streamline patterns.

An experimental investigation of the flow induced by a line jet in a linear-density stratified reservoir fluid was conducted. Both buoyant and non-buoyant jets were discharged into the stratified model and jet discharge and model length were varied. Experimental data indicated the two-dimensional flow field could be divided into three regions: (1) open region above equilibrium level, (2) closed region below equilibrium level, and (3) a central jet with adjacent entrainment rotors. True steady state flow was not achieved. The pattern of induced flow showed no distinctive changes when model length or jet discharge were varied, but the induced flow pattern showed appreciable changes when jet buoyancy was varied from neutral to buoyant. Maximum flow speed, rotor size, and entrainment were significantly increased for the buoyant jet. (Adams - ISWS)

THE SELECTION AND APPLICATION OF SLURRY PUMPS,
E. L. Arnold.
Pumps and Their Applications, The International Technical Review, No 105, p 763-967, June, 1975. 10 fig.

Descriptors: *Slurries, *Centrifugation, *Pumps, *Design criteria, Hydraulic engineering, Liquids, Construction materials, Waste water treatment.
Identifiers: Slurry pumps.

Basic facts concerning when to specify a slurry rated pump, which type of pump to use, and proper application of such pumps are reviewed. The centrifugal slurry pump may be used for municipal sewage, industrial wastes, and evaporator-crystalizer fluids, and should be considered when the fluid to be pumped contains more solids than are found in potable water. Choice of pump should be initially based on the liquids to be pumped in terms of physical and chemical characteristics. Other influences on the choice of pump include required heads and capacities, plant layout considerations, and economic requirements. Basic pump material is usually cast iron, sometimes reinforced with 3% nickel for corrosion protection. Also, materials such as rubber linings may be used for pump protection. The main working basis for pump selection is the System Curve. This is illustrated by several graphs and represents a plot of the head which must be met by the pump at any given series of capacity points, as determined by the piping. Thus, once the static nature of the slurry is known, and the plant requirements and manufacturer's specifications are stated, one can choose a slurry pump that meets design requirements and has performance curves, which when laid on the System Curve form an intersection at a point low enough to minimize wear. SWITCHING VALVE FOR CONTINUOUS FILTERING DEVICES,
Agfa-Gevaert, Mortsel (Belgium).
M. L. Beuselinck.
United States Patent 3,896,029. Issued July 22, 1975. Official Gazette of the United States Patent Office, Vol 936, No 4, p 1385-1386, July, 1975. 1 fig.

Descriptors: *Patents, *Flow, Liquids, Equipment, *Valves, Filtration, Water treatment, Waste water treatment, Conduits.

A flow control unit has been patented which selectively controls fluid flow from a common inlet conduit through two loop-shaped flow paths into a common outlet conduit. Each loop-shaped flow path includes a filtration unit. Control is achieved by a valve which has a supply inlet port connected to the inlet conduit and two loop inlet ports arranged in an angularly spaced relation about the axis of the valve housing. Part of the valve rotates within its housing and is in continuous communication with the common inlet conduit. Thus a wall is defined, larger in angular extent than either of the loop inlet ports, so that by rotating the valve either of the ports can be exclusively used to feed the flow of liquids. Flow may be through each loop discharge port alternatively or through both together. (Kramer-FIRL)

NG OF STORAGE RESERVOIRS AND OONS--THE LATEST TECHNIQUES IN IN-LLATION AND JOINTING,
ulson.
r Services, Vol 79, No 952, p 235-237, June, 4 fig, 2 tab.

riptors: *Synthetic rubber, Reservoirs, oons, Installation, *Joints(Connections), truction materials, *Linings.
ifiers: *Jointing, Butyl, EPDM, Hypalon, rvoir linings.

hetic rubber membranes for lining permanent voirs and lagoons have been used recently. e different rubber materials which can be effi-ly jointed and installed are Butyl, Hypalon, EPDM. All three must have been manufac- to correct specifications; must have been factorilly fabricated into large sheet sizes r factory-controlled conditions, using correct ing techniques for their particular product; nust have installation and site jointing carried by skilled and fully trained operators. Butyl EPDM are discussed in detail; in terms of hering, chemical properties, permeability, mechanical resistance, these materials are g and long-lasting. In order to construct a turally sound reservoir, however, it is neces-to follow recommendations for the embank- and reservoir base. The substrate must be th; efficient under-drainage systems must been built before addition of the membrane; precautionary measures must be taken if any bility of natural gas leakage exists. Both l and EPDM are factory-made in sheets and nized together by the use of heat pressure n uncured tape which is placed between the s before heat and pressure are applied. ts may be jointed on site, and must be erly anchored into a reservoir. Hypalon may upported or unsupported and is used in a -supported form to waterproof lagoons or voirs. Hypalon is the least affected by ozone ultraviolet light. (Kramer-FIRL)
00632

NESE LOADING TESTS ON BERNOLD NG SYSTEM.
els and Tunnelling, Vol 4, No 4, p 320, July, 3 fig.

riptors: Tunnels, Testing, Strength of materi-onstruction materials, Construction joints.
ifiers: Japan, Bearing capacity, Bernold s.

Loading tests to determine the influence of Bernold sheets on the bearing behavior of thin semi-stiff tunnel vaults with large spans have been conducted in Japan. The test piece is a concrete arch section 25 cm thick by 8 meters in length and reinforced by 2 mm-thick Bernold sheets. Under a distributed load of 2.7 tons/cubic meter, no cracks larger than .05 mm were determined. This compared with a broad flanged girder which ruptured under a load smaller than 20 tons/square meter. Results confirm that Bernold sheets have a very high bearing capacity and their joints do not cause any weakness in the structure. Sandoski-FIRL)
W76-00767

32-FOOT VERTICAL SHAFT BUILT WITH CONCRETE PIPE.
The American City, Vol 87, No 12, p 28, December, 1972. 2 fig.

Descriptors: Concrete pipes, Construction, Pipes, Sewers, Waste water treatment.

To avoid blocking a busy intersection, a vertical shaft and 75 feet of tunneling were used to connect two sewers with a 32-foot differential in elevation. The vertical shaft consisted of 36-inch concrete pressure pipes with tees at the upper and lower end. A special reducer connects the 36-inch pipe to the 48-inch tee at the lower end. This tee at the base of the shaft permits a slight buildup of water that serves as a liquid cushion at the bottom of the 32-foot drop. An eight-inch riser pipe connected to the vertical shaft at the ends and third point eliminates the possibility of a vacuum developing. The top of the shaft, capped with a concrete bulkhead plug, can be reached by means of a manhole extending to the street surface. (Sandoski-FIRL)
W76-00776

TUNNELLING METHOD BREAKS NEW GROUND.
Surveyor, Vol 140, No 4189, p 27, September 22, 1972. 2 fig.

Descriptors: *Tunneling, *Tunneling machines, *Tunnels, Soils, Sewers, Water supply, Safety, Costs, Bentonite.

A new method and equipment for tunneling difficult sand and gravel includes the introduction of bentonite to the basic method used in tunneling through soft ground with an excavator shield. The use of the new machine and technique eliminates or reduces the use of compressed air, which can cause bone necrosis in tunnel miners, and also reduces the risk of subsidence. With the tunneling machine, similar to other excavator shields designed for soft tunneling, the cutters revolve in a sealed chamber which is filled with a thixotropic slurry of bentonite clay under pressure. Bentonite holds up the tunnel face, sinking into the gravel for some inches and forming a skin to seal it. One tunnel ring at a time is built up from cast iron segments in the tail of the machine and the machine pushes itself forward by jacking against the completed ring. The development of this method will considerably reduce tunneling costs and also have an important of the building of underground railways as well as becoming applicable to tunnels for sewers, water supply, or electric cables. Tunnels can be constructed at relatively shallow depths below buildings or roads without danger according to present experience with the application of this technique. (Sandoski-FRIL)

McGill Univ., Montreal (Quebec).
E. McKyes, and R. S. Broughton.
Canadian Agricultural Engineering, Vol 16, No 2, p 60-62, December, 1974. 5 fig, 6 ref.

Descriptors: *Drainage, *Drainage effects, *Drainage engineering, *Drainage practices, Filtration, Drains, Materials testing.

Drainage systems frequently fail in fine sandy soils because of particles entering drain tiles in sufficient quantity to block the drains. Attempts have been made to employ filters outside tiles to allow only soil-free water to enter the system. Some commercially available or promising filters for corrugated plastic drain tubes were tested and their effect on water and soil entry into tubes over approximately 2 mo of continuous operation was assessed. Compared with unfiltered tubes, those with polyester weave stocking filters and fiberglass showed very little soil entry and a good continued waterflow. (Skogerboe-Colorado State)
W76-00832

PIPELINE PIG OR SWIPE,
H. J. Girard.
Canadian Patent 994,109. Issued March 26, 1974. Patents/Brevets, Vol 102, No 13, p 1062, March 26, 1974.

Descriptors: *Patents, *Pipes, *Sewers, *Cleaning, Pipelines, Plastics.
Identifiers: Swipes, Pigs(Devices).

A patent has been issued for a pig or swipe for use in cleaning pipe lines and for maintaining fluids separated while being transmitted through the line. It is adapted to be propelled through the line by a pressure gradient. The pig includes a sponge-like body of foamed plastic material, having an external coating of durable material (unfoamed plastic) in which reenforcing material (wire mesh or glass fabric) may be embedded to increase resistance to wear. The covering is applied to leave openings through which the sponge-like body may project into wiping contact with the surroundings internal surface of the pipe. The pig also has a barrier layer at one end positioned to close the sponge-like body against the passage of fluid, and to form a fluid tight seal with the surrounding pipe. The invention includes a method and apparatus for making the pigs or swipes. (Murphy-FIRL)

MINI TUNNELLING SYSTEM.
Gas World, Vol 176, No 4599, p 309, October 14, 1972. 3 fig.

Descriptors: *Tunnels, *Tunneling machines, Trenches, Pipes, Tunnel construction, Soil pressure.

LIBRARY U. OF I. URBANA-CHAMPAIGN

The Mini Tunnel is a complete fully integrated segment built tunneling system replacing sewer trenching in urban areas and accommodating pipes up to 48 inches in diameter. Using thin shell segments, built-in stress inducers keep the structure in compression to tolerate variable soil pressures. Aerohydraulics are used to move the shield through the ground as 120 degree concrete segments are built in the shield tail. Differential pressure steering produces accurate alignment control. The system is competitive with open trench sewer laying at shallow depths. The whole package, including a two-ton crane to handle materials, a tool compressor to drive the shield and gravel injector, and a Mini Mule for underground transportation, with a total weight of six tons, economizes on site-to-site haulage. (Sandoski-FIRL)
W76-00782

PERMIT APPLICATION BY RADCLIFF MATERIALS, INC. DREDGING OF DEAD-REEF SHELLS, MOBILE BAY, ALABAMA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Mobile, Ala.
February 1973. 198 p, 3 tab, 1 map.

Descriptors: *Dredging, *Oysters, *Bays, *Benthic fauna, Turbidity, Ecosystems, Environmental Effects, Alternative planning, Photosynthesis, Mud, Alabama.
Identifiers: *Environmental Impact Statement, *Mobile(Ala).

The project consists of dredging oyster shell from four areas within the confines of Mobile Bay, Alabama. The shell dredge will resuspend materials present in the bay bottom which have been isolated from the day-to-day bay ecosystem for a long period of time. Benthic organisms will be destroyed by the cutting of the dredge and smothered by the mud flow. Turbidity caused by the dredging will reduce photosynthesis slowing the repopulation of benthic organisms. Some dredging of small amounts of live oysters is unavoidable. There are three alternatives to the approval of the permit application: denial of the permit, issuance of the permit with conditions of non-renewal at its expiration, or issuance of the permit with restrictions. The Water Research Laboratory (WRL) is a section of the School of Civil Engineering of the University of New South Wales. Specializing in research, design, and investigation of water engineering problems, it is active in the areas of graduate instruction in hydraulics and water resources; basic research of water engineering problems; design, planning, and investigation of water engineering projects; co-ordination of multi-discipline projects in the development of water resources; hydraulic model studies; computer analysis and mathematical models; field surveys; calibration and testing of pumps and meters; and library services. During the 1974 basic research studies were undertaken in the fields of groundwater, coastal and estuarine hydraulics, multi-density flow, water resources, water supply, and open channel hydraulics. Brief descriptions of 57 research projects were given. (Robinson-ISWS)

International Association of Hydrological Sciences, Ottawa (Ontario).
Department of the Environment, Ottawa, Ontario (Canada), Inland Waters Directorate.410 p.

Descriptors: *Hydrology, *Bibliographies, *Canada, Meteorology, Surface waters, Rivers, Lakes, Snow, Sedimentation, Groundwater, Soil moisture, Water quality, Water pollution, Data collections, Reviews, Information retrieval.

A bibliography of information relating to hydrology in Canada was compiled. References were listed in the areas of general hydrology, hydrometeorology, surface water, subsurface waste, bio-hydrology, forest hydrology, water quality, and pollution. An author index was provided. (Robinson-ISWS)
W76-00532

HYDROLOGY AND WATER RESOURCES, A SYLLABUS OF REFERENCES FOR TEACHING INTRODUCTORY COURSES IN THE WATER ENVIRONMENT.
National Committee for the International Hydrological Decade, Washington, D.C.
Available from the National Technical Information Service Springfield, Va 22161 as PB-238-071.
National Academy of Sciences-National Research Council, Washington, D.C., August 1972. 73 p. NSF-C-310.

Descriptors: *Education, *Bibliographies, *Publications, *Hydrology, *Water resources, Water, Water properties, Hydrologic cycle, Atmosphere, Groundwater, Soil moisture, Watersheds(Basins), Streamflow, Water utilization, Floods, Wetlands, Water pollution, Water Management, Decision making, Remote sensing, Technology, Research and development.
Identifiers: Syllabus.

This syllabus provides a detailed guide to teaching courses in general hydrology and water resources fields and offers a large number of references. Reflecting the current concern for both the science and management of water, it includes references to physical aspects of water and to economic, political, and social stresses placed on that physical system by the complex demands for water in the United States. The syllabus is outlined in sufficient detail to be capable of being used as a basis for a wide variety of instructional needs, ranging from a 2-hour lecture series to a full semester introductory courses in hydrology and water resources problems. The syllabus is in the form of an annotated topical outline. Each topic is subdivided to provide increasingly detailed information. An instructor should find an adequate selection of basic introductory material to meet needs. The bibliography of references includes 1,000 sources. (Robinson-ISWS)

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 9, NUMBER 3
FEBRUARY 1, 1976

THE LIBRARY OF THE
MAR 4 1976
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W76-01001 -- W76-01500
CODEN: SWRABW

LIBRARY U. OF I. URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service, U.S. Department of Commerce, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates are: SWRA Journal only, $75 ($95 foreign); Journal and Annual Indexes, $100 ($125 foreign); Indexes only, $50 ($65 foreign).

Some documents abstracted in this journal can be purchased from NTIS at prices shown in the entry; prices subject to change. Other documents are available from originating organizations or authors as indicated in the citation.

(Rev. Nov. 1975)

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

LIBRARY U. OF I. URBANA-CHAMPAIGN

VOLUME 9, NUMBER 3
FEBRUARY 1, 1976

W76-01001 -- W76-01500

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

LIBRARY U. OF I. URBANA-CHAMPAIGN

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD----------iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY U. OF I. URBANA-CHAMPAIGN

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

GALERKIN FINITE-ELEMENT SIMULATION OF A GEOTHERMAL RESERVOIR,
Geological Survey, Reston, Va.
J. W. Mercer, Jr., and G. F. Pinder.
Geothermics (Italy), Vol 2, Nos 3 and 4, p 81-89, September-December, 1973. 11 fig, 10 ref.

Descriptors: *Geothermal studies, *Thermal water, *Steam, *Mathematical models, *Energy transfer, Porous media, Equations, Fluid mechanics, Thermodynamic behavior, Heat flow, Methodology.
Identifiers: *Geothermal systems, Geothermal reservoirs.

The equations describing fluid flow and enrgy transport in a porous medium can be used to formulate a mathematical model capable of simulating the transient response of a hot-water geothermal reservoir. The resulting equations can be solved accurately and efficiently using a numerical scheme which combines the finite element approach with the Galerkin method of approximation. Application of this numerical model to the Wairakei geothermal field demonstrates that hot-water geothermal fields can be simulated using numerical techniques currently available and under development. IONIZATION OF WATER IN SEAWATER,
Oregon State Univ., Corvallis School of Oceanography.
C. H. Culberson, and R. M. Pytkowicz.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-002 106, $3.50 in paper copy, $2.25 in microfiche. Marine Chemistry, Vol 1, p 309-316, 1973. 3 tab, 19 ref. NR 083-102. ONR N00014-67-A-0369-0007.

Descriptors: *Ionization, *Sea water, *Salinity, *Chemical properties, *Hydrogen ion concentration, Ions, Chemical reactions, Saline water, Alkalis(Bases), Temperature, Physical properties, Chemistry, Alkalinity, Hydrolysis, Measurement, Analysis, Laboratory tests.
Identifiers: *Ion product, *Activity coefficients, *Ionic strength, *Hydroxide ion concentration, Molar concentrations, Artificial seawater.

The ion product of water in seawater and the total activity coefficents of hydroxide and hydrogen ions were determined over the temperature range 2 to 35C and the salinity range 20 to 44 parts per thousand. At 25C and 35 parts per thousand salinity, the measured values were pK(SW)/W=13.20, the activity coefficient of the hydroxide ion equaled 0.22 and the activity coefficient of the hydrogen ion equaled 0.71 the molar concentration scale. INFILTRATION MODEL WITH REGARD TO THE SURFACE RUNOFF (EIN INFILTRATIONSMODELL UNTER BERUECKSICHTIGUNG DES LANDOBERFLAECHENABFLUSSES),
K. Theile.
Wasserwirtschaft/Wassertechnik, Vol 22, No 12, p 415-419, 1972. 4 fig, 2 tab, 10 ref.

Descriptors: *Model studies, *Surface runoff, Rainfall, Infiltration, Soils, Watersheds(Basins).
Identifiers: Surface retention, Horton's diffusion model.

An infiltration model, based on Horton's diffusion model, has been developed for the determination of runoff in watershed areas. The basic parameters of the computerized model are in principle measurable. As the surface runoff phase as a boundary condition of the infiltration process is considered, event-specific characteristics of the runoff formation are obtained. The initial water content in the ground immediately before rainfall constitutes a determining factor for the relationship of infiltration to surface runoff as it influences the surface retention and the soil infiltration capacities. Watershed areas with fairly homogeneous vegetation are subdivided into wet parts responsible for surface runoff and dry parts with high infiltration capacity for modeling purposes. Applications of this model to areas with abundant precipitation show good agreement with observations. (Sandoski-FIRL)
W76-01053

CONCEPTUAL MODEL DESIGN FOR MOTORWAY STORMWATER DRAINAGE,
C. J. Swinnerton, M. J. Hall, and T. O'Donnell.
Civil Engineering and Public Works Review, Vol 68, No 799, p 123, 125-127, 129, February, 1973. 4 fig, 2 tab.

Descriptors: *Model studies, *Drainage, Storm water, Rainfall-runoff relationships, Rainfall intensity, Hydrographs.
Identifiers: Highway drainage, Road runoff.

Highway drainage is complicated by the necessity to drain both the pavement and the shoulder in one continuous system. In an attempt to clarify the factors which affect the design of such systems, the Road Research Laboratory began in late 1960 to collect rainfall and runoff data at six sites. Subsequent analysis of some 17 station-years of data under the terms of a research contract between the Road Research Laboratory and the Imperial College of Science and Technology, University of London, has indicated the feasibility of using a conceptual modeling technique for design purposes. The conceptual model which forms the basis of the proposed design method consists of a single linear reservoir having two alternate values of its storage parameters, namely k1 for periods of rain and k2 for periods of no rain. Using the total rainfall on only the impervious area as input, the model estimates runoff hydrographs using equations for periods of rain and for periods of no rain. The time interval used in the present study was two minutes and the units of rainfall intensity and rate of runoff were inches per day. The value of k1 and k2 to be used for any given site and rainfall distribution may be estimated from the equations. (Sandoski-FIRL)

NUTRIENT AND SEDIMENT DISCHARGE FROM AGRICULTURAL WATERSHEDS IN OKLAHOMA,
Agricultural Research Service, Durant, Okla. Water Quality Management Lab.
A. Olness, S. J. Smith, E. D. Rhoades, and R. G. Menzel.
Journal of Environmental Quality, Vol 4, No 3, p 331-336, July - September, 1975. 1 fig, 3 tab, 19 ref.

Descriptors: *Surface runoff, *Sediment yield, *Agricultural watersheds, *Nitrogen, *Phosphorus, *Ranges, Nutrients, Chemical analysis, Watershed management, Cultivated lands, Fertilizers, Oklahoma, Soil erosion, Precipitation(Atmospheric), Rainfall-runoff relationships, Runoff, Topsoil, Vegetation effects, Nitrates, Grazing, Range management.
Identifiers: Ranageland watersheds.

Seven cropland watersheds and four rangeland watersheds in central Oklahoma were monitored for surface hydrology and discharge of nitrogen, phosphorus, and sediment over a 1 year period in which precipitation and runoff were much above normal. Sediment losses from the continuancy grazed rangeland watersheds ranged from 18 to 23 metric tons/hectare during the study. None of the sediment losses from the other watersheds exceeded 10 metric tons/hectare. Total nutrients discharged in runoff ranged from 2 to 15 kilograms/hectare of N and 1 to 11.5 kilograms/hectare of P. Flow-weighted mean concentrations ranged from 1 to 6 parts per million of total N, 0.2 to 1.9 ppm of nitrate-N, 0.5 to 4.8 ppm of total P, and 0.04 to 0.9 ppm of soluble P. Cropland watersheds had much greater concentrations of soluble phosphorus in runoff than rangeland watersheds. Loss of fertilizer N and P did not exceed 5 percent of the most recent applications, even though surface runoff was 4 to 10 times greater than that observed in previous years. (Robinett-Arizona)
W76-01116

WATER RESOURCE SYSTEMS AND RELATIONS,
Clark Univ., Worcester, Mass. Dept. of Environmental Affairs.
H. E. Schwarz.
Reviews of Geophysics and Space Physics, Vol 13, No 3, p 468-472, 525-528, July, 1975. 137 ref.

Descriptors: *Water resources, *Groundwater resources, *Water sources, *Synthetic hydrology, Networks, Surface water availability, Hydrologic cycle, Water management(Applied), Water policy, Water quality, Water resources development, Water supply, Water utilization, Surface-groundwater relationships, Surface waters, Hydrology, Groundwater, Mathematical models, Stochastic processes, Systems analysis, Decision making.
Identifiers: Stochastic flow models.

Water resources systems analysis has come to mean the use of mathematical programming and simulation techniques in the study of large-scale systems which control the movement of water on and under the surface of the earth. In addition to the use of these techniques in analyzing and synthesizing physical systems, significant inputs are being made to broaden the analysis to social, economic, and environmental considerations. A review is presented of surface water systems, groundwater systems, water quality systems, stochastic flow models, decision theory, and network theory. (Robinett-Arizona)
W76-01118

SNOWPACK DYNAMICS IN RELATION TO INVENTORY-PREDICTION VARIABLES IN ARIZONA MIXED-CONIFER,
Arizona Univ., Tucson. Dept. of Watershed Management.
M. A. Warren.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Master of Science Thesis, 1974. 77 p, 6 fig, 5 tab, 53 ref, 3 append.

Descriptors: *Snowpacks, *Snowmelt, *Radiation, *Coniferous forests, *Snow management, Arizona, Runoff, Snowfall, Runoff forecasting, Snow surveys, Water sources, Water supply, Snow, Canopy, Interception, Slopes, Cutting management, Water yield, Statistical methods, Regression analysis.
Identifiers: Snow accumulation, Radiation duration.

Snowpack measurements were made on 93 plots for 6 different dates during the winter of 1973-1974 to determine the forest-terrain-snow relationships of the mixed conifer forests in Arizona. Using regression techniques, two sets of equations were developed representing the accumulation and melt periods and storage-duration index. During the accumulation period, the 2 most dominant processes were the interception of falling snow by the overhead canopy and the duration of the sun's direct radiation on the plot. During the melt period, the slope and aspect and the duration of the sun's direct beam radiation on the plot were most dominant. The presence of timber was involved in 3 of the 4 most dominant processes during the entire winter season. Using this information as input, the land manager can develop cutting presecriptions within a multiple-use framework to yield the highest possible runoff. (Robinett-Arizona)
W76-01123

VALIDATION OF SNOWPACK INVENTORY PREDICTION RELATIONSHIPS IN ARIZONA PONDEROSA PINE FORESTS,
Arizona Univ., Tucson. Dept. of Watershed Management.
B. W. Welch.
Master of Science Thesis, 1975. 59 p, 11 fig, 16 tab, 31 ref.

Descriptors: *Snowpacks, *Snow management, *Runoff forecasting, *Water equivalent, *Forest watersheds, Arizona, Snow, Snow surveys, Snowmelt, Water yields, Melt water, Melting, Runoff, Local precipitation, Ponderosa pine trees, Mountain forests, Watershed management, On-site investigations.
Identifiers: Snowpack inventory prediction.

A validation study of snowpack inventory-prediction equations was conducted during 1972-73 in three study sites within the Arizona ponderosa pine forests. The orginial inventory-prediction equations proved inadequate, possibly because the snowpack water equivalent for 1972-73 was five-to-nine times above normal. New snowpack inventory-prediction equations were then developed. (McLachlan-Arizona)

For primary bibliographic entry see Field 5B.
W76-01195

DIMENSIONLESS INLET HYDROGRAPH MODEL,
Maryland Univ., College Park. Dept. of Civil Engineering.
R. M. Ragan, M. J. Root, and J. F. Miller.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY9, Proceedings Paper No 11580, p 1185-1195, September 1975. 5 fig, 1 tab, 11 ref, 1 append.

Descriptors: *Urban hydrology, *Hydrograph analysis, *Hydrology, *Hydraulics, *Unit hydrographs, *Urban runoff, *Simulation analysis, *Mathematical models, Storm runoff, Storm drains, Model studies.
Identifiers: *Inlet hydrographs, *Drainage design, Kinematic wave, Linked system models.

A number of mathematical models used to estimate storm hydrographs in urban areas consider runoff as a deterministic process and link a series of submodels to simulate the behavior of the various components of the runoff cycle. Because of the number of interrelated formulations in these linked system models, a large core computer is generally required for their proper use. A dimensionless inlet hydrograph was presented that can be developed from a complete linked system model and used as a substitute in some planning and design situations. The central objective was to develop a method for estimating the hydrograph entering an inlet or catch basin that would be simple enough to allow hand computations while retaining good agreement with the computer-generated hydrographs obtained with a complete linked system model. WATER RESOURCES OF VOLCANIC ISLANDS, A PILOT PROJECT IN THE CANARIES,
D. Fernandopulle, R. H. Rodriguez, and J. S. Oiza.
Nature and Resources, Vol 11, No 1, p 8-12, January-March 1975. 1 fig, 1 tab.

Descriptors: *Water resources, *Islands, *Data collections, *Projects, Groundwater, Water wells, Aquifers, On-site investigations, On-site data collections, Runoff, Evaporation, Pumping, Infiltration, Water balance, Water supply, Agriculture, Water properties, Surface runoff, Rainfall, Geochemistry, Sounding, Analytical techniques, Groundwater movement, Analysis, Networks, Surveys, Hydrology, Hydrogeology, Model studies, Sampling, Management, Planning.
Identifiers: *Canary Islands(Spain), Volcanic islands, Galleries.

The project for the Scientific Study of the Water Resources of the Canary Islands, carried out in 1970-1974 by Spain, UNESCO, and the United Nations Development Program, served as a pilot for the planning of water-resource management in islands of volcanic origin. Hydrometeorological and hydrogeological networks furnished data on surface runoff evaporation, water levels in wells, pumping systems, and physico-chemical characteristics of the water. Detailed studies were carried out to test the behavior and 'limits' of given parameters by means of infiltration tests using controllable sprinklers, pumping tests, and plot tests to determine consumption in agriculture. Special investigations included electrical and seismic soundings, use of infra-red technique to detect offshore springs, analysis of stable isotopes and tritium in the water, special borings, experimental geochemical study of the water-rock relationship, and simulation of the aquifer by models. The data acquired during the project resulted in a better understanding of water resources available for current and future use and provided a basis for management policies. Emphasis should be placed on the construction of deep wells in the most suitable parts of the island, and the drilling of sloping gallery wells or controlled-discharge wells in coastal areas. It was demonstrated that it is possible and necessary to treat a whole island as a single hydraulic unit. The importance of vertical secondary fissures to groundwater movement and stratification were brought to light. (Robinson-ISWS)

THE IMPORTANCE OF ACCURATE CURVE NUMBERS IN THE ESTIMATION OF STORM RUNOFF,
Utah State Univ., Logan. Watershed Science Unit.
R. H. Hawkins.
Water Resources Bulletin, Vol 11, No 5, p 887-891, October 1975. 2 fig, 3 ref, 1 append.

Descriptors: *Storm runoff, *Rainfall-runoff relationships, Hydrology, Runoff, Rainfall, Storms.
Identifiers: *Curve number, *Error analysis.

Storm runoff as calculated by the runoff curve number method was shown to be of varying sensitivity to both input rainfall and curve number. This method was used to estimate rainstorm runoff volume on ungaged small watersheds for specific storms. Using an assumed input error of 10%, a runoff error chart was given. Up to about 9 inches of rainfall, runoff was more sensitive to curve number than to rainfall. An accurate estimate of curve number was clearly the weak input link for the method, and the importance of accurate curve number selection in this range was stressed. This 10% error, however, may arise solely from physical conditions in the watershed. More engineering and research attention should be paid to representative watershed studies with curve numbers in mind. (Lardner-ISWS)

HYDROGRAPH SYNTHESIS USING MATHEMATICAL MODELS,
Wollongong Univ. Coll. (Australia). Dept. of Civil Engineering.
M. J. Boyd.
In: Hydrology Symposium, Armidale, Australia, 1975. The Institution of Engineers, Australia, Preprints of Papers, p 117-121, May 1975. 3 fig, 7 tab, 13 ref.

Descriptors: *Hydrographs, *Mathematical models, Routing, Storm runoff, Unit hydrographs, Watersheds(Basins), Rainfall-runoff relationships.

Four mathematical catchment models are examined with regard to the synthesis of storm runoff hydrographs. All models compare favourably with the unit hydrograph method while considerable improvement is obtained by the more realistic models. Model parameters, derived by fitting hydrographs, are shown to correlate highly with the catchment characteristics. (CSIRO)

AN EVALUATION OF THREE RAINFALL-RUNOFF MODELS,
Monash Univ., Clayton (Australia). Dept. of Civil Engineering.
I. D. Moore, and R. G. Mein.
In: Hydrology Symposium, Armidale, Australia, 1975. The Institution of Engineers Australia, Preprints of Papers, p 122-126, May 1975. 6 tab, 6 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, Watersheds(Basins), Computer models, Australia, Testing, Evaluation, Optimization, Model studies.

Three mathematical rainfall-runoff models, the Boughton model (with a modification to include base flow), the Monash model, and the Stanford Watershed model (slightly modified for daily input data) were applied to four catchments in Australia

on a daily basis. The procedure used was to fit the model parameters on several years of data and to test the model performance on a different data period. Evaluation of the models is made on results, ease of use, and computational time required. (CSIRO)

PROBLEMS IN THE PROGRAMMED OPTIMISATION OF A HYDROLOGICAL CATCHMENT MODEL,
Commonwealth Scientific and Industrial Research Organisation, Canberra (Australia). Div. of Land Use Research.
M. J. Goodspeed.
In: Hydrology Symposium, Armidale, Australia, 1975. The Institution of Engineers Australia, Preprints of Papers, p 127-130, May 1975. 2 fig, 1 tab, 13 ref.

Descriptors: *Optimization, *Demonstration watersheds, *Rainfall-runoff relationships, *Computer models, Model studies, Watersheds(Basins), Small watersheds.

Investigations carried out in a search for the most appropriate method for optimisation of a deterministic model to be used in the Australian Representative Basins Programme are outlined. With efficiency of use of computing time as a major objective, a simple model which could simulate rainfall-runoff behaviour reasonably well was formulated. Trial optimisations were then performed by two methods for a chosen representative basin. In each case the effects of varying the objective function was studied. (CSIRO)
W76-01420

SIMULATION OF THE RAINFALL-RUNOFF PROCESS USING A HYSTERETIC INFILTRATION-REDISTRIBUTION MODEL,
New South Wales Univ., Kensington (Australia). School of Civil Engineering.
K. K. Watson, and S. J. Lees.
In: Hydrology Symposium, Armidale, Australia, 1975. The Institution of Engineers Australia, Preprints of Papers, p 131-135, May 1975. 6 fig, 11 ref.

Descriptors: *Soil profiles, *Infiltration, *Hysteresis, *Rainfall-runoff relationships, *Numerical analysis, Soil moisture, Water storage, Hyetographs, Depression storage, Mathematical models.

The significance of the soil profile and its accompanying water status in deterministic models is discussed in relation to the current use of the soil-store concept. An alternative numerical approach is described in which the movement of water into and through the soil profile (together with the determination of runoff volumes) is continuously monitored during any pattern of rainfall and non-rainfall events. A significant component in the approach is the use of a comprehensive domain-type hysteresis model for the analysis of infiltration-redistribution sequences. The simulation is illustrated by using a rainfall hyetograph of seven hours durat ion (including one non-rainfall period of one hour) as the flux input into a homogeneous profile of a sandy loam of uniform initial water content. The time-dependent relationships of rate of surface flux, depression storage and runoff volume are calculated for the furation of the hyetograph period. Profiles of water content are also presented. (CSIRO)
W76-01421

FLOOD FREQUENCY DISTRIBUTION IN A CATCHMENT SUBJECT TO TWO RAINFALL PRODUCING MECHANISMS,
Queensland Irrigation and Water Supply Commission, Brisbane (Australia). Surface Water Resources Branch.
N. M. Ashkanasy, and W. D. Weeks.
In: Hydrology Symposium, Armidale, Australia. 1975. The Institution of Engineers Australia, Preprints of Papers, p 153-157, May 1975. 3 fig, 6 tab, 6 ref.

Descriptors: *Storm structure, *Statistical methods, *Frequency analysis, *Flood frequency, Storm runoff, Flood peak, Watersheds(Basins), Rainfall-runoff relationships, Peak discharge, Rainfall disposition.

Traditional techniques for determining the statistical distribution in estimation of extreme flood events in an apparently typical catchment are shown to yield contradictory results. The physical significance of this failure is explained. A dual log-normal approach yields a more reasonable estimate, but it is suggested that some uncertainty remains. A major conclusion is that at least in certain cases, extreme events belong to a statistical population which is entirely distinct from that of ordinary annual maxima; the existence of this phenomenon can only be detected by a careful consideration of physical processes. (CSIRO)

COMPARISON OF SOME CALCULATION METHODS FOR RAINWATER RUNOFF (VERGLEICH EINIGER BERECHNUNGSMETHODEN VON REGENWASSERKANALISATIONEN),
J. F. Gruhler, and V. Adamik.
Wasserwirtschaft-Wassertechnik, Vol 25, No 7, p 239-242, 1975. 2 fig, 2 tab, 11 ref.

Descriptors: *Mathematical studies, *Storm runoff, *Rainfall-runoff relationships, Sewerage, Sewers, Storage, Forecasting, Rain water, *Methodology.

The Imhoff-Reinhold; Hauff-Vikari-Kehr; Gruhler; and Pecher methods; the hydrographic method developed in the United States; and a method developed in the USSR for the calculation of rainwater runoff are compared. These calculation methods involve widely differing calculation time requirements, and considerably different sewer system investment costs. The time coefficient method developed by Imhoff and Reinhold is applicable to the construction of most new projects. The Hauff-Vikari-Kehr method may be necessary in special cases, such as for large new sewer networks. The resources of existing sewer systems that may have to be enlarged are best investigated by the Gruhler method, with respect to their storage capacities. (Takacs-FIRL)

RAINDROP-SIZE DISTRIBUTIONS IN THE MELBOURNE AREA,
Bureau of Meteorology, Melbourne (Australia).
P. A. Barclay.
In: Hydrology Symposium, Armidale, Australia, 1975. The Institution of Engineers Australia, Preprints of Papers, p 112-116, May 1975. 2 fig, 3 tab, 10 ref.

Descriptors: *Raindrops, *Distribution patterns, *Radar, Rainfall intensity, Classification, Size, Measurement, Synoptic analysis, *Australia.
Identifiers: Melbourne(Vic).

The results of measurements of raindrop distributions in Melbourne, Australia, and the classification of these distributions to demonstrate the differences for given rain types and for rain from different synoptic situations is presented. An important relationship between radar reflectivity factor Z and rainfall rate R, both measured from the drop-size distributions is determined for each classification with a view to subsequent use in radar rainfall measurement. The equipment used to measure raindrop size is briefly outlined. (CSIRO)

A PHOTOGRAPHIC TECHNIQUE FOR MEASUREMENTS OF ATMOSPHERIC PARTICLES IN SITU FROM AIRCRAFT,
National Center for Atmospheric Research, Boulder, Colo.
T. W. Cannon.
Journal of Applied Meteorology, Vol 14, No 7, p 1383-1388, October 1975. 5 fig, 4 ref.

Descriptors: *Photography, *Particle size, *Aircraft, *Cameras, Particle shape, Drops(Fluids), Ice, Atmosphere, Storms, Rainfall, Cloud physics, Instrumentation, Equipment, Data processing, Meteorology.
Identifiers: *Atmospheric particles.

In situ photographs were taken of atmoshperic particles with radius 4 micrometer and larger with a special particle camera installed on a research sailplane. Ice particle shapes, sizes and concentrations, raindrop sizes and concentrations, and microscopic cloud particle concentrations and size estimates were obtained from the photographs. Liquid particles could be distinguished from ice particles if their radii exceeded about 50 micrometer. (Sims-ISWS)

A REEXAMINATION OF THE EQUILIBRIUM CONDITIONS IN THE THEORY OF WATER DROP NUCLEATION,
Mainz Univ. (West Germany). Institut fuer Meteorologie.
F. Herbert.
Tellus, Vol 27, No 4, p 406-413, 1975. 1 fig, 14 ref.

Descriptors: *Nucleation, *Drops(Fluids), *Aqueous solutions, Water vapor, Evaporation, Condensation, Equilibrium, Cloud physics, Cloud seeding, Weather modification, Precipitation(Atmospheric), Meteorology, Thermodynamics.
Identifiers: *Equilibrium conditions, Curvature, Kelvin equation.

The thermodynamic equations necessary to describe the conditions for equilibrium between a highly curved surface of a liquid and its vapor were re-examined. The complete equilibrium behavior was reduced to one single differential equation for each component in an arbitrary c-component system. It was shown that this general formulation can be specialized to describe the conditions for equilibrium between water vapor and a pure water drop, the drop carrying an electric charge, containing a water soluble substance, and/or containing a water insoluble nucleus. In the light of the present formulation, some incorrect physical statements of treatments by various authors reported in literature were pointed out. In an added note, the energy of homogeneous water drop formation was discussed and some erroneous conclusions which commonly are drawn in the literature from formulations on the energy of nucleus formation were mentioned. (Sims-ISWS)

FREEZING NUCLEATION IN AQUEOUS ELECTROLYTES,
Wyoming Univ., Laramie. Dept. of Atmospheric Sciences.
M. T. Reischel, and G. Vali.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Tellus, Vol 27, No 4, p 414-427, 1975. 9 fig, 4 tab, 31 ref. Bureau of Reclamation, 14-06-D-6801, NWC N000123-72-C-0911.

Descriptors: *Nucleation, *Freezing, *Aqueous solutions, *Electrolytes, Laboratory tests, Silver iodide, Salts, Drops(Fluids), Chemistry of precipitation, Precipitation(Atmospheric), Weather modification, Cloud seeding, Chemistry, Meteorology.

Experiments were performed to determine the extent to which the nucleating abilities of artificial and natural freezing nuclei are influenced by the presence of salts dissolved in water. Four different nucleants (at fixed concentrations) were tested in combinations with 10-20 soluble salts using the drop freezing technique. Changes in freezing temperatures were determined for each nucleant-salt combination at salt concentrations of 0, 0.01, 0.1 and 1 molal. Major differences were noted in the responses of the different nucleants and it was concluded that the influence of dissolved salts on heterogeneous freezing nucleation is not due to changes in the bulk water structure, but results from modifications at the nucleant-embryo interface. The measurements indicated that the salt contents of cloud droplets can be expected to alter the ice nucleating activities of suspended particles by as much as plus or minus 4C. (Sims-ISWS)

THE LIFE CYCLE OF CALIFORNIA COASTAL FOG ONSHORE,
Calspan Corp., Buffalo, N.Y.
C. W. Rogers, E. J. Mack, U. Katz, C. C. Easterbrook, and R. J. Pilie.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A003 392, $5.00 in paper copy, $2.25 in microfiche. Report No CJ-5076-M-3, September 1974. 96 p, 17 fig, 4 tab, 10 ref, 3 append. AFCRL F19628-72-C-0160.

Descriptors: *Fog, *Coasts, *California, Sea breezes, Land breezes, Winds, Temperature, Drops(Fluids), Aerosols, Clouds, Condensation, On-site investigations, Meteorology.
Identifiers: *Fog microphysics, Visibility.

The life cycle of California coastal fog was investigated by examining visibility, temperature, and wind data obtained on a 56 m tower in 10 fog occurrences at Vanderberg Air Force Base in July 1972. The Vandenberg radiosonde data showed that fog did not form when the base of the large scale subsidence inversion was located 400 m or more above the earth's surface. Fog formed at the surface as the base of the oceanic stratus cloud lowered in response to net long wave radiational cooling at the cloud top after sunset. With strong onshore gradient winds, fog was a quasi-steady state phenomenon during the period between fog formation in the evening and fog dissipation by evaporation after sunrise. With weak onshore gradient winds (strong sea breeze circulation), an offshore land breeze occurred near midnight and brought visibility improvement produced by heating over the land. The amount of improvement was inversely related to the time after sunset of the onset of the land breeze, and was directly related to the visibility values present prior to the wind shift. The subsequent shift to onshore flow after midnight brought quasi-steady state fog conditions until dissipation occurred after sunrise. Fog microphysics data acquired in the 10 fogs were found to be consistent at the surface with previous observations in coastal fogs occurring both on land and at sea. The measurements showed, further, that drop concentration and liquid water content increased with height while mean droplet size and visibility decreased with height at least to 42 m above the surface. COMBINED BALANCE STUDIES AT SELECTED GLACIER BASINS IN CANADA,
Department of Fisheries and Forestry, Ottawa (Ontario). Inland Waters Branch.
A. D. Stanley.
In: Glaciers; Proceedings of Workshop Seminar, 1970, British Columbia University, Vancouver, British Columbia (Canada), September 24-25, 1970. Canadian National Committee for the International Hydrological Decade, Ottawa, Ontario (Canada), p 5-9 (1970). 1 fig, 2 tab, 21 ref.

Descriptors: *Glaciers, *Hydrology, *Energy budget, *Water balance, Measurement, International Hydrological Decade, Glaciology, Basins, Melting, Ablation, Cold regions, Canada.
Identifiers: Mass balance.

The balance measurements being made at six selected glacier basins in western Canada were reviewed. Following an initial program to obtain mass balance measurements at a large number of basins, standard data are being collected each summer at these six glacier basins. Mass balance, water balance, and energy balance measurements are being made. The combined balances program at selected glacier basins has been successful in developing a unified approach to some aspects of the hydrology of alpine areas. (See also W76-01240) (Sims-ISWS)

MASS BALANCE MEASUREMENTS RELATED TO SURFACE GEOMETRY ON PEYTO GLACIER, ALBERTA,
McGill Univ. Montreal (Quebec). Dept. of Geography
G. Young.
In: Glaciers; Proceedings of Workshop Seminar, 1970, British Columbia University, Vancouver, British Columbia (Canada), September 24-25, 1970. Canadian National Committee for the International Hydrological Decade, Ottawa, Ontario (Canada), p 11-20 (1970). 8 fig, 4 ref.

Descriptors: *Glaciers, *Shape, *Snowfall, *Ablation, Melting, Measurement, Topography, Glaciology, Mapping, Cold regions, Canada.
Identifiers: Mass balance, Snow accumulation.

Progress on a study of the Peyto Glacier in Alberta, Canada, was reported. The hypothesis that is being tested is that the shape of the surface of the glacier is associated with both the patterns of accumulation and the patterns of melting. Shape or geometry parameters that are likely to be important are altitude, slope angle, azimuth of slope, and bumpiness of the surface. The most important conclusions reached so far are that accumulation patterns, while differing markedly for individual storms, tend to be similar at the end of each winter. However, gross amounts of accumulation can vary greatly and the overall patterns are not so similar that the pattern for one year will automatically be repeated in every detail the next year. (See also W76-01240) (Sims-ISWS)
W76-01243

THE REGIME OF THE WARD HUNT ICE SHELF AND OF THE ICE IN THE MOUTH OF NANSEN SOUND, ELLESMERE ISLAND,
Defence Research Board, Ottawa (Ontario).
G. Hattersley-Smith.
In: Glaciers; Proceedings of Workshop Seminar, 1970, British Columbia University, Vancouver, British Columbia (Canada), September 24-25, 1970. Canadian National Committee for the International Hydrological Decade, Ottawa, Ontario (Canada), p 21-22 (1970). 4 ref.

Descriptors: *Glaciers, *Ice, *Sea ice, Ablation, Regime, Climatology, Melting, Arctic Ocean, Cold regions, Canada.
Identifiers: *Ice shelves, Snow accumulation, Ellesmere Island.

The ice about Ward Hunt Island has been ablating at an average rate of only about 60 mm/yr since 1958, and has been accreting at the rate of about 30 mm/yr since 1963. It seems that ice conditions at the north end of Nansen Sound are reverting to what they were in the early part of the century, when travellers reported very old unbroken floes. Present climatic conditions off the north coast of Ellesmere Island allow very thick developments of landfast sea ice to form up to the point where they may be regarded as incipient ice shelves. THE CANADIAN GLACIER INVENTORY,
Department of Fisheries and Forestry, Ottawa (Ontario). Inland Waters Branch.
S. Ommanney.

In: Glaciers; Proceedings of Workshop Seminar, 1970, British Columbia University, Vancouver, British Columbia (Canada), September 24-25, 1970. Canadian Ontario (Canada), p 23-30 (1970). 5 fig, 2 tab, 25 ref.

Descriptors: *Glaciers, *Surveys, *Mapping, *Canada, International Hydrological Decade, Water supply, Data collections, Ice, Water balance, Energy budget, Rocky Mountain region, Cold regions, Glaciology, Census.

In 1968 the Glacier Inventory Section was established within the Glaciology Subdivision and charged with completing the inventory of Canadian glaciers according to the International Commission of Snow and Ice recommendations and with carrying out other related studies. Only the glacier inventory of Axel Heiberg Island is finished and in print. Eleven hundred and twenty-one glaciers were identified covering 11,735 sq km or 31.5% of the total land area. Measurement of 191 glaciers on Vancouver Island has been completed and the final Vancouver Island glacier inventory report is in preparation. All the glaciers on Baffin Island (10,224), Bylot Island (575), and Devon Island (1,411) have been identified and index maps are in preparation or in print. Work maps have been compiled for several areas in the Rocky Mountains. This inventory of Canadian glaciers will establish a datum for all glaciers and will permit a more accurate calculation of the magnitude of the water supply potential of these glaciers. THE HYDROLOGY OF GLACIERS,
British Columbia Univ., Vancouver. Dept. of Geology.
W. H. Mathews.
In: Glaciers; Proceedings of Workshop Seminar, 1970, British Columbia University, Vancouver, British Columbia (Canada), September 24-25, 1970. Canadian National Committee for the International Hydrological Decade, Ottawa, Ontario (Canada), p 31-32 (1970). 7 ref.

Descriptors: *Glaciers, *Lakes, *Hydrology, Ice, Floods, Glaciology, Cold regions, Iced lakes, Canada.
Identifiers: Ice-dammed lakes.

One of the major problems encountered in the study of the hydrology of glaciers is setting up models to adequately account for phenomena which, for the most part, can be observed only from the exterior of the glacier or by remote sensing from its surface. The example of the ice-dammed Summit Lake in the Granduc area which periodically drains and floods the Salmon River below the ice dam illustrated this problem. The general behavior of Summit Lake was discussed along with the economic benefits of finding a way to control the flooding produced by such lakes. (See also W76-01240) (Sims-ISWS)
W76-01246

HYDROLOGY OF GLACIERIZED BASINS--SUMMARY OF RESEARCH BY GLACIOLOGY SUBDIVISION,
Department of Fisheries and Forestry, Ottawa (Ontario). Inland Waters Branch.
L. Derikx, and H. Loijens.
In: Glaciers; Proceedings of Workshop Seminar, 1970, British Columbia University, Vancouver, British Columbia (Canada), September 24-25, 1970. Canadian National Committee for the International Hydrological Decade, Ottawa, Ontario (Canada), p 33-35 (1970). 4 ref.

Descriptors: *Glaciers, *Hydrology, Instrumentation, Measurement, Ablation, Melt water, Streamflow, Headwaters, Melting, Model studies, Cold regions, Glaciology, Runoff, Canada.
Identifiers: Snow accumulation.

The research being done to study the glacier melt contribution to streamflow in the North Saskatchewan River headwaters and the hydrology of the Peyto Glacier was summarized. Measurements and instrumentation were described. Models and the analysis procedures were discussed. (See also W76-01240) (Sims-ISWS)

EXPERIMENTAL STUDIES ON GLACIER CLIMATOLOGY--ESPECIALLY FOR THE MELT-CLIMATE RELATIONSHIPS,
McGill Univ., Montreal (Quebec). Arctic Meteorology Research Group.
A. Ohmura.
In: Glaciers; Proceedings of Workshop Seminar, 1970, British Columbia University, Vancouver, British Columbia (Canada), September 24-25, 1970. Canadian National Committee for the International Hydrological Decade, Ottawa, Ontario (Canada), p 37 (1970).

Descriptors: *Glaciers, *Melting, *Climatology, Mathematical models, Glaciology, Radiation, Heat transfer, Meteorology, Instrumentation, Tundra, Cold regions.
Identifiers: Mass balance.

The two experimental studies presented are a part of the glacial-meteorological projects currently being carried out by the Axel Heiberg Expedition. The present experiment suggests that for the small- and middle-scale glaciers on Axel Heiberg Island, the tundra surface conditions and also the sea surface conditions will significantly influence the melting process for glaciers. If the thorough process of glacier melt is to be fully grasped, glaciologists must examine not only the glaciers themselves, but the surrounding areas as well. (See also W76-01240) (Sims-ISWS)
W76-01248

THE RELATION BETWEEN ABLATION AND GLOBAL RADIATION OVER PEYTO GLACIER, ALBERTA,
Toronto Univ., (Ontario). Dept. of Geography.
B. Goodison.
In: Glaciers; Proceedings of Workshop Seminar, 1970, British Columbia University, Vancouver, British Columbia (Canada), September 24-25, 1970. Canadian National Committee for the International Hydrological Decade, Ottawa, Ontario (Canada), p 39-42 (1970). 2 fig, 4 ref.

Descriptors: *Glaciers, *Ablation, *Radiation, Correlation analysis, Measurement, Ice, Meteorology, Melting, Glaciology, Cold regions, Canada.
Identifiers: Peyto Glacier.

During the 1969 field season, a micro-meteorological site was established on Peyto Glacier, and continuous measurement of the shortwave components of the radiation balance became an integral part of this project. In particular, one problem to investigate was the relationship between global radiation and surface ablation of the ice. A correlation analysis showed no significant relationship between these two variables. This can be explained because global radiation is only part of the radiation balance (and only a part of one term in the energy balance equation). Even the inclusion of the shadow effect results in a negligible change in the correlations. The present work is an initial study into the distribution of global radiation over Peyto Glacier, and its relationship to ablation. There is a significant difference in the received solar radiation for any area depending upon its slope, azimuth, and perhaps shadow conditions, but these differences alone do not dictate any statistically meaningful relationship between the two variables. More information is required about the other radiation and energy balance components, both at a point and in a spatial context. (See also W76-01240) (Sims-ISWS)

THE APPLICATION OF ICE PHYSICS TO GLACIER STUDIES,
Department of Energy, Mines and Resources, Ottawa (Ontario). Earth Physics Branch.
W. S. B. Paterson.
In: Glaciers; Proceedings of Workshop Seminar, 1970, British Columbia University, Vancouver, British Columbia (Canada), September 24-25, 1970. Canadian National Committee for the International Hydrological Decade, Ottawa, Ontario (Canada), p 43-46 (1970). 21 ref.

Descriptors: *Glaciers, *Physics, *Measurement, Radioactivity, Estimating, Melt water, Tritium, Ablation, Cold regions, Glaciology, Ice, Snow, Dating.
Identifiers: *Ice thickness, Mass balance, Thermoluminescence, Snow accumulation.

Work in physics can help by suggesting alternative ways of obtaining information, either through providing a new technique or by using results derived from theoretical studies of glacier flow. In some cases, the alternative method may be better than the existing one; in others, it may at least be useful as a check. Several examples were described, including: (1) estimation of ice thickness, (2) estimation of mean annual ablation rate by measurement of emergence velocity, (3) estimation of ice thickness changes from strain rate measurements, (4) simplified mass balance measurements, (5) electrical methods of measuring ice thickness, (6) thermoluminescence, (7) radioactive fallout as a reference horizon for accumulation measurements, (8) measurement of tritium content to distinguish between meltwater from snow and meltwater from glacier ice, and (9) dating methods. TEMPERATURE MEASUREMENTS IN FOX GLACIER, YUKON TERRITORY,
British Columbia Univ., Vancouver. Dept. of Geophysics and Astronomy.
G. K. C. Clarke.
In: Glaciers; Proceedings of Workshop Seminar, 1970, British Columbia University, Vancouver, British Columbia (Canada), September 24-25, 1970. Canadian National Committee for the International Hydrological Decade, Ottawa, Ontario (Canada), p 47-48 (1970). 3 fig, 1 ref.

Descriptors: *Glaciers, *Temperature, Ice, Measurement, Thermal properties, Glaciology, Cold regions, Canada.
Identifiers: Fox Glacier, Yukon Territory.

Fox Glacier lies in the Steele Creek drainage basin in the Icefield Ranges, Yukon Territory. It is a small (4 km long) surging glacier, at present in its quiescent phase. To investigate the thermal regime, thermistor cables were inserted in holes made with electrically-powered thermal drills. All temperatures were below the pressure melting point except in hole 7, at the bottom of which a layer, some 10 m thick, of ice at the pressure melting point was encountered. There were no 'hot spots' other than the one in the vicinity of hole 7. That the glacier has this peculiar thermal regime must surely be related to its surge behavior. Whether the observed hot spot is the cause of the glacier's surge activity, or a consequence of its most recent surge, is still open to question. (See also W76-01240) (Sims-ISWS)

APPLICATION OF ISOTOPE TECHNIQUES TO GLACIER STUDIES,
Alberta Univ., Edmonton. Dept. of Physics.
H. R. Krouse.
In: Glaciers; Proceedings of Workshop Seminar, 1970, British Columbia University, Vancouver, British Columbia (Canada), September 24-25, 1970. Canadian National Committee for the International Hydrological Decade, Ottawa, Ontario (Canada), p 49-59 (1970). 9 fig, 23 ref.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Glaciers, *Radioisotopes, *Isotope fractionation, *Isotope studies, Flow, Climatology, Glaciology, Paleoclimatology, Precipitation(Atmospheric), Tracers, Ice, Cold regions, Canada.

Stable isotope studies show considerable promise for elucidating problems in glaciology. As many factors can alter isotope abundances, it is necessary to effect many measurements in order to obtain unambiguous interpretations. However, information can be obtained which is not available from other techniques. Therefore, the considerable amount of work involved seems justified. (See also W76-01240) (Sims-ISWS)

TOWARD NEW MASS AND HEAT BUDGETS FOR THE ARCTIC OCEAN,
Washington Univ., Seattle. Dept. of Oceanography.
K. Aagaard, and P. Greisman.
Journal of Geophysical Research, Vol 80, No 27, p 3821-3827, 1975. 1 fig, 3 tab, 26 ref. ONR N00014-67-A-0103-0023, N00014-67-A-0103-0021.

Descriptors: *Heat budget, *Arctic Ocean, *Mass, *Advection, Heat flow, Subsurface waters, Ice, Shear, Bathymetry, Water temperature, Current meters, Heat balance.
Identifiers: *Mass budget, West Spitsbergen Current, Eurasian Basin, Baffin Bay, East Greenland Current, Bering Strait, Geographic features, Net heat flux, Water budget, Salt budget.

Recent current measurements were incorporated into new heat and mass budgets for the Arctic Ocean. These budgets demonstrated the overwhelming importance of advection by the West Spitsbergen Current, which in 1971-1972 transported 16.3 times 10 to the 9th power kcal/sq cm/s into the Arctic Ocean. Partially on the basis of the heat budget, it was suggested that there was a large heat loss to the atmosphere in the southwestern Eurasian basin, in excess of 20 kcal/sq cm/yr. Annual mean transport in the West Spitsbergen Current could easily have varied by 35% and might have constituted a significant perturbation on the Arctic heat budget. The mass budgets pointed toward the general ineffectiveness of the Arctic Ocean in transforming subsurface water masses, and they also indicated a large shear between the ice and the upper layer of the East Greenland Current. (Roberts-ISWS)

MORPHOLOGY OF AN ARCTIC RIVER BAR,
Louisiana State Univ., Baton Rouge. Center for Wetlands Resources; and Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
L. S. McKenzie, III, and H. J. Walker.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-003 586, $4.00 in paper copy, $2.25 in microfiche. Technical Report No 172, November 1974. 32 p, 48 fig, 35 ref. ONR N00014-69-A-0211-0003.

Descriptors: *Arctic, *Sand bars, *Geomorphology, *Alaska, Rivers, Coasts, Glaciology, Ice, Climatology, Erosion, Sedimentation, Cold regions, Land forming, Running waters, Floods, Sedimentology, Alluvium, Alluvial channels, Sediments, Deltas, Permafrost.
Identifiers: *Colville River(Alas).

River bars are a common landscape element in the valleys of the coastal plain of northern Alaska. They are especially numerous in the Coleville River delta, the largest delta north of the Brooks Range. Most river bars in the Arctic are submerged for only a short period of time during river breakup, and most of those occurring on the lee side of river channels are bordered by sand dunes. Putu bar, located near the head of the Colville delta, is of this type. Like other river bars, it possesses a number of small forms. The structural and temporal variation of some 18 microrelief features was investigated during the 1971 field season, which lasted from before the initiation of snowmelt in late winter to late summer. Each feature was classified as to when it formed, how long it persisted, and what processes were involved. It was found that winter, although it prevails throughout most of the year, is generally a period of little activity on Putu bar. Most alterations on the bar are the result of the fluvial activity occurring during the short spring and summer. Cryoturbation, an important process in the development of many arctic landforms, is negligible in the formation of the microrelief features investigated on Putu bar. (Sims-ISWS)

ACCUMULATING SNOW TO AUGMENT THE FRESH WATER SUPPLY AT BARROW, ALASKA,
Cold Regions Research and Engineering Lab., Hanover, N. H.
C. W. Slaughter, M. Mellor, P. V. Sellmann, J. Brown, and L. Brown.
Available from the National Technical Information Service, Springfield, Va 22161 as ADA-005-031, $3.50 in paper copy, $2.25 in microfiche. Special Report 217, January 1975. 21 p, 12 fig, 4 tab, 16 ref, append.

Descriptors: *Snow management, *Water supply, *Alaska, Windbreaks, Permafrost, Reservoirs, Runoff, Snowfall, Snowmelt, Surface waters, Water storage, Water distribution(Applied), Water delivery, Arctic, Cold regions, Snow, Snowpacks.
Identifiers: *Snow accumulation, Barrow(Alaska), Snow fence.

With appropriate snow management techniques, it appears that local freshwater runoff could be significantly increased in northern Alaska to provide additional water for community needs. At Barrow, Alaska, snow fences 1.5 and 2.7 m high were installed in September 1972 at two orientations (north-south and east-west). By February 1973 the fences were near saturation. Influence of the fences was evident at 10-15 times fence height on both sides of the fences. Surface reworking and slight accumulation increases were shown in subsequent April and June measurements. Snow accumulation on adjacent, relatively flat terrain at all three measurement times was about 40 cm depth. The average increase in water equivalent over the drift cross section for the 1.5 m fence was 15 cm, with a maximum of 50 cm within 1.0 m of the fences. For the 2.7 m fence, the average increase in water equivalent was 45 cm, with a maximum of 1.5 m within 1 meter of the fence. Snow density at each measurement time was in the range of 0.40 to 0.55 g/cu m. (Roberts-ISWS)
W76-01323

UNIVERSITY OF WASHINGTON WATER STRESS STUDIES,
Washington Univ., Seattle. Dept. of Oceanography.
L. K. Coachman, and J. D. Smith.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A005 373, $3.50 in paper copy, $2.25 in microfiche. Technical Report No 2, January 1971. 8 p, 1 fig, 19 ref. ONR N00014-67-A-0103-0021.

Descriptors: *Sea ice, *Arctic Ocean, *Ocean currents, Hydrodynamics, Ocean waves, Boundary layers, Boundary processes, Projects, On-site investigations, Fluid mechanics, Stress, Oceanography.
Identifiers: *Water stress.

During the 1970 AIDJEX Pilot Study, the University of Washington oceanographic study explored possible techniques for measuring water stress on the ice and ice deformation. The specific experiments outlined for the 1971 pilot study were: (1) the measurement of the time-dependent velocity and Reynolds stress fields in the nonuniforms turbulent boundary layer under the ice; (2) current measurements to relate the deeper flows to those in the boundary layer; (3) to measure the approach to geostrophy of the flow; and (4) accurate positioning of the two satellite stations as well as of the main station, so that the deformation of the triangle could be followed. (Sims-ISWS)
W76-01485

THEORETICAL CALCULATIONS OF INTERNAL WAVE DRAG ON SEA ICE,
Washington Univ., Seattle. Dept. of Atmospheric Sciences.
F. Rigby.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A003 614, $3.50 in paper copy, $2.25 in microfiche. Technical Report No 26, 1974. 12 p, 6 fig, 9 ref. ONR N00014-67-A-0103-0007.

Descriptors: *Sea ice, *Internal waves, *Drag, *Arctic Ocean, Hydrodynamics, Interfaces, Waves(Water), Ocean waves, Model studies, Mathematical models, Fluid mechanics, Dynamics, Stress, Oceanography.
Identifiers: *Water stress.

Because of the density stratification in the upper part of the Arctic Ocean, the movement of pressure ridge keels through the mixed layer can create internal waves in the vicinity of the pycnocline. These waves transport energy away from the keels and thereby generate drag on the ice. The study defined the conditions under which wave drag could contribute significantly to the total water stress. The development of internal waves downstream from a semielliptical keel was described by a simple two-dimensional, two-layer ocean model. Results calculated from the model showed the dependence of wave drag on keel depth, current speed, depth of the upper layer, and density change across the interface between the layers. Comparison of the relative magnitudes of form drag and wave drag suggested that wave drag is not negligible near large keels when the current is flowing strongly. (Sims-ISWS)
W76-01486

CHARACTERIZATION OF SLUSH ICE IN THE GREAT LAKES,
Coast Guard Research and Development Center, Groton, Conn.
J. P. Welsh, and B. T. Kingsbury.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A006 450, $3.50 in paper copy, $2.25 in microfiche. Report No CG-D-45-75, November 1974. 17 p, 10 fig, 3 tab.

Descriptors: *Ice, *Slush, *Lake ice, *Great Lakes, Surveys, On-site investigations, Measurement, Ice cover, Ice-water interfaces, Iced lakes, Navigation, Lakes.
Identifiers: *Slush ice.

Slush ice is a mixture of fresh water ice and water. It becomes an impediment to navigation when wind and water current transport the ice fragments into a restricted channel or harbor. The characteristics of slush ice identified and measured were draft, ice to water ratio (surface aspect only), and ice particle size distribution. Draft was measured using a sonar transducer set on the bottom of a channel and echoing off the underside of the slush ice. The water to ice ratio was obtained from photographs of slush ice taken from a helicopter. The ice particle size distribution was obtained by physically measuring ice particles in the field. The last technique is only useful where one can walk

on the slush ice. The ability to gather other data that may characterize slush ice is hindered by many factors. For example, conventional approaches to field observation and sampling are not very useful. One reason is that slush ice cannot always be walked on. (Sims-ISWS)
W76-01487

METHODS OF AVALANCHE CONTROL IN WASHINGTON MOUNTAIN HIGHWAYS--SUMMARY REPORT,
Washington Univ., Seattle. Dept. of Civil Engineering; and Washington Univ., Seattle. Geophysics Program.
E. R. LaChapelle, C. B. Brown, and R. J. Evans.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 107, $3.50 in paper copy, $2.25 in microfiche. Research Program Report 8.6, July 1974. 18 p, 1 tab, 12 ref, 2 append.

Descriptors: *Avalanches, *Protection, *Highways, *Washington, Snow, Snow management, Hazards, Disasters, Safety, Mountains, Forests.
Identifiers: *Avalanche control.

This summary report synthesized the work on avalanche control carried out at the University of Washington from 1970-1974. The annual reports contained a full account of all of the activities and should be referred to for further details. Five problems were faced in the protection of a highways from avalanche catastrophe. These were: (1) identification of avalanche paths, (2) description of historical frequency and size of avalanches, (3) prediction of avalanching, (4) identification of control methods, and (5) inclusion of control and prediction schemes in highway design and operation. The summary was intended to bring together the four-year study under the problem titles identified. Most of the work has been addressed to the specific features of the North Cascades Highway (SR-20) in the North Cascade Mountains of Washington State. Applications to other sites were mentioned as they arose. (Sims-ISWS)

2D. Evaporation and Transpiration

ESTIMATING EVAPORATION AND TRANSPORTATION FROM CLIMATOLOGICAL OBSERVATIONS,
Dept. for the Environment. Ottawa (Ontario). Hydrology Research Div.
F. I. Morton.
Journal of Applied Meterology, Vol 14, No 4, p 488-497, June, 1975. 5 fig, 10 ref, append.

Descriptors: *Evaporation, *Transpiration, *Model studies, *Estimating, *Climatic data, Physical properties, Climatology, Evaporation pans, Evapotranspiration, Hydrologic cycle, Solar radiation, Temperature, Water balance, Water loss, Humidity, Systems analysis, Mathematical models, Synthetic hydrology, River basin, Air temperature, Photoperiodism.

Evaporation and transpiration are estimated from routine climatological observations using a conceptual model that requires no assumptions concerning the availability of water. The versatility of this unorthdox approach is demonstrated by comparing model and water budget estimates for 118 river basins in Canada, Ireland and the southern United States. This technique provides estimates of evaporation and transpiration from a large area from interactions with the temperature, humidity and sunshine duration without using local fudge factors. The model requires accurate humidity data. It cannot be used near sharp environmental discontinuities, for short time periods, for deep lakes with large seasonal changes in subsurface heat storage, or to predict the effects of natural or man-made changes. (Robinett-Arizona)

EFFECT OF MOISTURE STRESS ON RED MAPLE SEEDLINGS FROM DIFFERENT SEED SOURCES,
Agricultural Research Service, Delaware, Ohio. Shade Tree Ornamental Plants Lab.
A. M. Townsend, and B. R. Roberts.
Can J Bot. Vol 51, No 10, p 1989-1995. 1973. Illus.
Identifiers: Acer-Rubrum *Maple trees, *Red maples, *Seedlings, Siblings, Swamps, *Moisture stress, Sites, *Transpiration.

Red maple (Acer rubrum L.) seedlings grown from half-sib seed collected from wet and dry sites were subjected to 3 levels of plant water stress. Transpiration on a per seedling and per unit leaf weight basis was greatest in seedlings from a swamplike site, at both high and low water potentials. Seedlings from the 2 wet sites came to temporary and permanent wilt sooner than seedlings from dry sites. However, at all levels of water stress, growth rates were greater for the seedlings from the wet sites than for those from the dry sites. At permanent wilt, the stem and leaf moisture content and the water potential values were highest in the seedlings from the swamplike site. At temporary wilt, the leaf water potential was lowest in seedlings from dry sites. Transpiration of seedlings from a swamplike site was double that of those from another wet site at the same leaf water potential.--Copyright 1974, Biological Abstracts, Inc.

SIMULATION OF EVAPORATION FROM BARE SOIL UNDER STEADY AND DIURNALLY FLUCTUATING EVAPORATIVITY,
Texas A and M Univ., College Station. Dept. of Soil and Crop Sciences and Texas Agricultural Extension Service, College Station.
D. Hillel.
Soil Science, Vol 120, No 3, p 230-237, September 1975. 7 fig, 16 ref.

Descriptors: *Simulation analysis, *Soil moisture, Numerical analysis, Soils, Evaporation, Time, Computers, Diurnal distribution, Cycles, Soil surfaces, Computer programs, Model studies, Flow system.
Identifiers: *Mechanistic numerical model, *Potential evaporation, Resorption, IBM System/360, Cyclic egvaporativity, Vapor diffusion, Isothermal flow theory.

A mechanistic numerical model was designed to compare evaporation of soil moisture under steady versus fluctuating evaporativity. The model, written in IBM System/360 CSMP language, required data on soil hydraulic characteristics and on potential evaporation. It calculated the rate and cumulative quantity of evaporation, as well as the change in profile water content and distribution, as functions of time. Computations carried out for a 10-day simulation illustrated the use of the model. The results confirmed experimental findings that the diurnal cycle of evaporativity caused nighttime resorption of moisture and hence an appreciably higher average wetness in the soil surface zone. The results also predicted that under cyclic evaporativity, the total evaporation tended to be lower than under the equivalent steady evaporativity. (Roberts-ISWS)

COMPARISON OF WARM WATER EVAPORATION EQUATIONS,
Canterbury Univ., Christchurch (New Zealand), Dept. of Civil Engineering.
R. N. Weisman.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY10, Proceedings Paper 11620, p 1303-1313, October 1975. 2 fig, 2 tab, 12 ref, 2 append.

Descriptors: *Evaporation, *Turbulence, Turbulent flow, Water, Velocity, Convection, Water vapor, Heat transfer, Momentum equation, Model studies, Roughness(Hydraulic), Friction, Bodies of water, Hydrology, Fluid mechanics, Cooling water, Hydraulics.
Identifiers: *Warm water evaporation, *Turbulent diffusion, Forced convection, Sensible heat flux, Empirical model, Fluid mechanical model, Velocity profile, Friction velocity, Roughness length.

Two methods of calculating the evaporation and, using the Bowen ratio, the sensible heat flux from warm water bodies were presented and their results compared. One method was empirical in that free convective and forced convective terms were simply added. The other method was a fluid mechanical approach combining the effects of free and forced convection in a nonlinear way by the use of the Monin-Obukhov similarity theory. The comparison of results depended on the value of roughness length. A specific roughness lenght allowed the results of the two methods to compare within several percent. (Roberts-ISWS)
W76-01310

GAMMA--THE PSYCHROMETER NON-CONSTANT,
Atmospheric Environment Service, Calgary (Alberta).
D. Storr, and G. den Hartog.
Journal of Applied Meteorology, Vol 14, No 7, p 1397-1398, October 1975. 2 fig, 1 tab, 8 ref.

Descriptors: *Evapotranspiration, *Energy budget, *Estimating, Analytical techniques, Pressure, Elevation, Humidity, Equations, Meteorology, Hygrometry.
Identifiers: *Psychrometer constant, Gamma, Potential evapotranspiration.

Using 0.66 mb/degree K for gamma, the psychrometric constant, can cause underestimates of evapotranspiration in excess of 5% at elevations above 1000 m. Graphs and equations were presented to prevent this error and to facilitate the caluclation of evapotranspiration. (Sims-ISWS)
W76-01473

ENERGY BUDGETS FOR THREE SMALL PLOTS--SUBSTANTIATION OF PRIESTLEY AND TAYLOR'S LARGE-SCALE EVAPORATION PARAMETER,
Rocky Mountain Forest and Range Experiment Station, Tempe, Ariz.
J. R. Thompson.
Journal of Applied Meteorology, Vol 14, No 7, p 1399-1402, October 1975. 2 fig, 1 tab, 7 ref.

Descriptors: *Evaporation, *Forests, *Energy budget, *Arizona, Data processing, Evapotranspiration, Latent heat, Solar radiation, Equations, Temperature, Humidity, On-site investigations, Meteorology.

Eleven days of energy balance data from three unsaturated land surfaces were collected in the White Mountains of Arizona. These data indicated the variability in alpha for unsaturated conditions, and seemed to verify that a constant value of 1.26 exists for saturated conditions. The 'index of aridity' (alpha/1.26), though not entirely logical for small-scale use, also seemed to substantiate the large-scale parameter. (Sims-ISWS)

MATHEMATICAL MODEL FOR THE FILLING PROCESS OF THE RETENTION BASIN STOEHNA (MATHEMATISCHES MODELL FUER DEN FUELLVORGANIC DES

LIBRARY U. OF I. URBANA-CHAMPAIGN

HOCHWASSER-RUECKHALTEBECKENS STOEHNA),
M. Meyer, H. Martin, and W. Kraatz.
Wasserwirtschaft/Wassertechnik, Vol 22, No 11, p 382-386, 1972. 5 fig, 2 ref.

Descriptors: *Mathematical models, *Model studies, Flow, Flood peak, Rivers, Flood control, Flood gates.
Identifiers: Flood retention basins.

A mathematical model is shown applicable to the simulation of nonstationary flow processes occurring during the filling of similar flood gate-controlled retention basins. The nonstationary flow process makes it necessary to assume the inflow according to the progress line to be constant during discrete intervals. Partial inflows are determined for the preset geometrical boundary conditions of the flow profiles in assuming a steady state for the individual intervals. Branching and friction losses as well as secondary flow are not considered in the model. Designed to level off flood peaks in a river, this model constitutes a valuable element in the planned process control of flood retention basins. (Sandoski-FIRL)

THE UTILIZATION OF TREE-RING DATA TO PREDICT HYDROLOGIC PROPERTIES OF SEMIARID WATERSHEDS NEAR TUCSON, ARIZONA,
Arizona Univ., Tucson. Dept. of Watershed Management.
J. K. Yu.
Master of Science Thesis, 1974. 106 p, 12 tab, 14 fig, 4 append, 87 ref.

Descriptors: *Climatic data, *Watersheds(Basins), *Dendrochronology, *Hydrologic cycle, *Runoff forecasting, Douglas fir trees, Runoff, Arizona, Streamflow, Flood forecasting, Flow, Precipitation, Mountain forests.
Identifiers: *Sabino Creek(Ariz), *Rincon Creek(Ariz), *Rillito Creek(Ariz), Tucson Basin(Ariz).

Four douglas-fir chronologies were collected from the mountains surrounding the Tucson basin. These tree-ring indices were analyzed and compared to the runoff records of Sabina Creek watershed, Rincon Creek watershed, and Rillito Creek watershed. The reconstructed data covered a 313 year period. The total variance explained by the prediction equation was 35% for Sabino Creek, 64% for Rillito Creek, and 34% for Rillito Creek. This runoff prediction was considered satisfactory for the Tucson Basin. (McLachlan-Arizona)

HYDROLOGIC DATA FOR LITTLE ELM CREEK, TRINITY RIVER BASIN, TEXAS, 1973,
Geological Survey, Austin, Tex.
R. M. Slade, Jr., and J. M. Taylor.
Open-file report, May 1975. 74 p, 2 fig, 3 tab.

Descriptors: *Hydrologic data, *Small watersheds, *Texas, *Rainfall-runoff relationships, Streamflow, Gaging stations, Flood protection, Flood control, Retaining walls, Hydrographs.
Identifiers: *Little Elm Creek(Tex), *Trinity River basin(Tex).

This report, the fourteenth in a series of basic-data reports published annually for the Little Elm Creek, Texas study area, contains the rainfall, runoff, and storage data collected during the 1973 water year for the 75.5 sq mi area above the stream-gaging station Little Elm Creek near Aubrey. The investigation is scheduled to continue through a period of both above- and below- normal precipitation to define the various factors used in the analyses of rainfall-runoff relationships. There are 12 floodwater- retarding structures in the Little Elm Creek watershed upstream from the stream-gaging station Little Elm Creek near Celina. These structures have a combined capacity of 9,490 acre-ft below the emergency spillway and control runoff from 28.4 sq mi or 61 percent of the area above the Celina stream-gaging station. Four floodwater-retarding structures are located in the area between the Celina and Aubrey stream-gaging stations. The 16 floodwater-retarding structures have a combined capacity of 12,340 acre-ft below the emergency spillway and control runoff from 35 sq mi, or 47 percent of the area above the Aubrey stream-gaging station. The average rainfall during the 1973 water year was 49.66 in or 133 percent of the 17-year (1957-73) average of 37.25 in. for the area. Monthly rainfall totals ranged from 0.68 in in December to 8.20 in in September. (Woodard-USGS)

FLOODS IN EASTERN LAJAS VALLEY AND THE LOWER RIO LOCO BASIN SOUTHWESTERN PUERTO RICO,
Geological Survey of Puerto Rico, San Juan.
K. G. Johnson.
Hydrologic Investigations Atlas HA-532, 1974. 1 sheet, 4 fig, 3 tab, 5 ref.

Descriptors: *Floods, *Flood profiles, *Floodplains, *Hydrologic data, *Puerto Rico, Maps, Hydrographs, Flood frequency, Flood data, Land use, Planning.
Identifiers: *Eastern Lajas Valley(PR), *Lower Rio Loco basin(PR).

Factual and interpretive information is provided for floods in eastern Lajas Valley and the lower Rio Loco basin in Puerto Rico. The land is devoted almost entirely to agriculture (mostly to the production of surgarcane). Occasional tropical storms and hurricanes can produce torrential rains, which usually cause flooding. Parts of the study area have been inundated extensively at least four times since the greatest known flood of September 13, 1928. Eighteen bridges are in the flood area. The water surface during the 1928 flood was above low beam on 12 of these bridges and 10 of the 12 bridges were inundated. Flood profiles were developed on the basis of elevations of floodmarks. (Woodard-USGS)

FLOODS IN LOMBARD QUADRANGLE, ILLINOIS,
Geological Survey, Champaign, Ill.
H. E. Allen, and V. J. May.
For sale by USGS, Reston, Va. 22092 Price $1.25 per set. Hydrologic Investigations Atlas HA-143, 1964 (reprinted 1975). 1 sheet, 7 fig.

Descriptors: *Floods, *Flood profiles, *Flood data, *Flood plains, *Illinois, Hydrologic data, Flood frequency, Maps, Hydrographs, Land use, Planning.
Identifiers: *Lombard quadrangle(Ill).

The approximate areas inundated by floods along streams in the Lombard 7 1/2-minute quadrangle in Illinois are delineated on a topographic map. Inundated areas are shown along Winfield Creek for the flood of May 1954; along Spring Brook, Meacham Creek, and East Branch Du Page River for the flood of October 1954; and along unnamed tributaries of East Branch Du Page River, Salt Creek tributary, and Klein Creek for the flood of September 1961. This study of hydrologic data should help to evaluate the depth and frequency of flooding that affect the economic development of flood plains. (Woodard-USGS)
W76-01183

FLOODS IN THE CAROLINA-RIO GRANDE AREA, NORTHEASTERN PUERTO RICO,
Geological Survey of Puerto Rico, San Juan.
W. J. Haire.
For sale USGS, Reston, Va 22092, Price $1.25. Hydrologic Investigations Atlas HA-533, 1975. 1 sheet, 7 fig, 4 tab, 7 ref.

Descriptors: *Floods, *Puerto Rico, *Flood profiles, *Flood data, Maps, Streamflow, Flow rates, Peak discharge, Flood frequency, Hydrographs.
Identifiers: *Carolina-Rio Grande area(PR).

This atlas provides hydrologic information on major floods in the Carolina-Rio Grande area, Puerto Rico. The data include tabulations of flood discharge and flood stage, flood profiles, and a map ofthe area inundated by the floods of September 6, 1960, and October 9, 1970. The areas of inundation and the flood profiles are specifically for conditions that existed at the time of the floods. A tabulation of flood-frequency data is presented for selected sites. The peak discharge of Rio Grande de Loiza at Loiza Dam was 170,000 cfs in 1960; for the 1970 flood it was 146,000 cfs. Upstream at the Caguas gaging station peak discharge was 71,500 cfs in 1960 and 62,800 cfs in 1970. (Woodard-USGS)
W76-01185

MAP SHOWING FLOOD-PRONE AREAS, GREATER DENVER AREA, FRONT RANGE URBAN CORRIDOR, COLORADO,
Geological Survey, Denver, Colo.
J. F. McCain, and W. R. Hotchkiss.
For sale USGS, Reston, Va 22092, Price $0.75. Miscellaneous Investigations Series Map I-856-D, 1975. 1 sheet, 1 map, 21 ref.

Descriptors: *Flood plains, *Maps, *Urbanization, *Flood protection, *Colorado, Flood frequency, Land development, Land use, Streamflow, Flow characteristics, Hydrologic data, Flood plain zon Watershed management.
Identifiers: *Greater Denver area(Colo).

The rapid growth of population in the Front Range Urban Corridor of Colorado is causing intense competition for available land resources. One form of competition posing serious problems is indiscriminate development of flood plains along creeks and rivers. This map depicts a broad-scale view of flood-prone areas along principal streams in the Greater Denver area of the urban corridor. Flood-prone areas identified are subject to inundation by the 100-year flood--a flood having a 1 percent chance of being equaled or exceeded in any given year. The magnitude and depth of this reference flood were derived for streams in the study area from streamflow records and reports of the U.S. Geological Survey, reports of the U.S. Army Corps of Engineers, and from reports prepared by various consulting engineering firms for the Urban Drainage and Flood Control District. (Woodard-USGS)
W76-01186

MAP SHOWING FLOOD OF APRIL 1975 AT EAST LANSING, MICHIGAN,
Geological Survey, Lansing, Mich.
R. L. Knutilla, and L. A. Swallow.
Open-file map, 1975. 1 sheet, 8 fig, 2 tab.

Descriptors: *Floods, *Maps, *Flood data, *Streamflow, *Michigan, Flow measurement, Discharge(Water), Flood damage, Aerial photography, Hydrographs, Flood peak, Peak discharge, Flood frequency, Sediment transport, Hydrologic data, Rainfall, Smowmelt.
Identifiers: *East Lansing flood April 1975, *Red Cedar River(Mich).

This is one of a series of map reports on the April 1975 flood in the Lansing, Michigan metropolitan area. The drainage area of the Red Cedar River at East Lansing is 355 square miles. About two weeks prior to the flood a heavy snow fell over most of the Red Cedar River basin. As much as 13 inches were recorded at some places. Subsequent melting increased streamflow. The extent of flooding along the Red Cedar River is shown on a photomosaic base map. A discharge hydrograph for the Red Cedar River at East Lansing shows the peak discharge of 5,940 cfs which occurred near midnight on April 20. This discharge is equivalent to a runoff of about 16.7 cfs per square mile of drainage area. A maximum sediment concentration of about 350 mg/litre at the gaging station on the Red Cedar River at East Lansing occurred on April 20; peak concentrations occurred several hours prior to the time of peak discharge. During the April 19-24 period, an estimated 11,500 tons of suspended sediment passed the gaging station. The flood has a recurrence interval of about 40 years, or about 2.5 percent chance of occurrence in any year. (Woodard-USGS)
W76-01188

MAP SHOWING FLOOD OF APRIL 1975, LANSING, MICHIGAN,
Geological Survey, Lansing, Mich.
J. B. Miller, and L. A. Swallow.
Open-file map, 1975. 2 sheets, 14 fig, 3 tab.

Descriptors: *Floods, *Maps, *Flood data, *Michigan, *Streamflow, Flow measurement, Discharge(Water), Flood damage, Aerial photography, Hydrographs, Flood peak, Peak discharge, Flood frequency, Sediment transport, Hydrologic data, Rainfall, Snowmelt.
Identifiers: *Lansing flood April 1975(Mich).

Discharge data for the flood of April 1975 in the Lansing, Mich., area were obtained on the Grand River at Lansing, Red Cedar River at East Lansing, Sycamore Creek near Holt, Mud Lake Drain near Lansing, and Carrier Creek near Lansing. Discharge hydrographs for these gaging stations are shown. The peak discharge of 11,200 cfs occurred on the Grand River at 6 p. m. on April 20. This discharge is equivalent to a runoff of 9.11 cfs per square mile of drainage area. The extent of flooding along the Grand River and the lower reaches of the Red Cedar River is shown on photomosaic base maps. Maximum sediment concentrations on the Grand River at the gaging station at Lansing were 300 to 350 mg/litre on April 19 and 20; peak sediment concentrations occurred several hours prior to the time of peak flow. During the April 19-24 period, an estimated 26,000 tons of suspended sediment passed the gaging station. The flood had a recurrence interval of slightly more than 10 years, or about a 10 percent chance of occurrence in any year. (Woodard-USGS)
W76-01189

MAP SHOWING FLOOD OF APRIL 1975 AT WILLIAMSTON, MICHIGAN,
Geological Survey, Lansing, Mich.
R. L. Knutilla, and L. A. Swallow.
Open-file map, 1975. 1 sheet, 9 fig, 1 tab.

Descriptors: *Floods, *Maps, *Flood data, *Michigan, *Streamflow, Flow measurement, Discharge(Water), Flood damage, Aerial photography, Flood peak, Peak discharge, Snowmelt, Flood frequency, Rainfall, Hydrologic data.
Identifiers: *Williamston(Mich), *Red Cedar River(Mich).

On April 18, 1975 the city of Williamston, Mich., experienced an intense rain storm that caused the Red Cedar River and the many small streams in the area to overflow their banks and resulted in the most devastating flood since at least 1904. Local officials estimated a loss of $775,000 in property damage. The extent of flooding along the Red Cedar River and Deer Creek is shown on the photomosaic base maps. The drainage area of Red Cedar River at Williamston is about 240 square miles. During the 7-hour duration of the April 18 storm, Williamston received 4.89 inches of rain. Precipitation of that intensity can be expected to occur only about once every 100 years on the average. At the time of the storm, streamflow was relatively high as a result of snowmelt from a heavy snowfall that had occurred 2 weeks earlier. The peak discharge at East Lansing was 5,940 cfs or 17 cfs per square mile. Runoff of Deer and Sloan Creeks was appreciably higher than for the Red Cedar at Williamston. (Woodard-USGS)

MEANDERING OF SUPRAGLACIAL MELT STREAMS,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
G. Parker.
Water Resources Research, Vol 11, No 4, p 551-552, August 1975. 2 fig, 4 ref.

Descriptors: *Geomorphology, *Meanders, *Glaciohydrology, Streams, Channels, Melt water, Melting, Freezing, Hydrodynamics, Heat transfer, Streamflow, Supercritical flow.
Identifiers: *Supraglacial melt streams.

During periods of glacial ablation, excess water often concentrates in supraglacial melt streams, which typically exhibit meandering. A stability analysis of straight supraglacial streams was carried out to determine the nature of meandering tendencies. Instability leading to meandering in the flow results from a combination of hydrodynamic and differential heating effects. The heat involved is apparently largely frictional. The analysis indicated that instability occurs only for supercritical flow and that the meander pattern does not migrate downstream. Meander wavelength was determined by channel width, depth, and Froude number. The results agreed with field observations. (Jess-ISWS)

WATER DECONTAMINATION THROUGH RAIN WATER TREATMENT IN STORM WATER RETENTION TANKS (ENTLASTUNG DER GEWASSER DUCH BEHANDLUNG DES

LIBRARY U. OF A. ERBANA-CHAMPAIGN

REGENWASSERS IN REGENUEBERLAUFBECKEN),
K. Krauth.
Wasserwirtschaft, Vol 63, No 2, p 42-46, February, 1973. 12 fig, 2 tab, 6 ref.

Descriptors: *Storm water, *Retention, *Waste water treatment, Sewerage, Canals, Design criteria, Overflow, Nutrient removal, Flow duration.
Identifiers: Storm water retention tanks, Clarification.

Recently developed storm water retention tanks to prevent main canal overload through polluted water have a bottom discharge, one of several overload outlets, and whose efficiency depends on their position in the sewer system. Criteria involved in their design include oveerflow frequency and quantity, the amount of sediment discharged into the main canal, and sediment load conveyed for clarification. Other factors include the average annual sediment, the frequency and extent by which this average is exceeded, and the effect of removed undissolved matter, oxygen-consuming organic matter, and nitrogen and phosphorus-containing nutrients. It is suggested that maximum inflow and minimum detention time factors should be used in the sizing of storm water retention tanks for sewer systems having preliminary discharge facilities and with flow durations exceeding 15 minutes. CALIFORNIA HIGH WATER, 1972-1973,
California State Dept. of Water Resources, Sacramento. Div. of Resources Development.
W. A. Arvola, J. S. Bartok, W. B. Chan, J. C. Bringham, and G. W. Patrick.
Available from California Dept. of Water Resources, Sacremento, 95802, for $2.00. Bulletin No 69-73, December 1974. 34 p, 6 fig, 1 tab, 2 append.

Descriptors: *Floods, *California, *Flooding, *Mudflows, *Storms, *Storm runoff, Runoff, Drainage, Rainfall, Excessive precipitation, Streamflow, Weather patterns, Tides, Winds, Flood stages, Hydrographs, Hydrology, Precipitation(Atmospheric), Peak discharge, Flood damage, Disasters.

The weather patterns of the 1972-73 flood season in California were characterized by a southerly displacement of the storm track which produced above-normal rainfall through the midcoastal and Central Valley areas of the state. This precipitation produced no significant flooding by any of the state's major streams; however, the combination of abundant and high-intensity rainfall caused local floods and mudslides so large and numerous that ten counties and one city were declared disaster areas during the season. The bulletin, 11th in an annual series, covered the period from October 1, 1972 through September 30, 1973, and described precipitation, runoff, flooding and the general weather patterns that preceded and coincided with storm periods. Also included were tabulations of precipitation comparisons and peak streamflows and stages, hydrographs of streamflow and reservoir operations, and weir overflow graphs. (Robinson-ISWS)

FLOOD OF JUNE 1972 IN THE SOUTHERN PEACE (SMOKY RIVER) BASIN, ALBERTA,
Department of the Environment, Calgary (Alberta). Water Resources Branch.
L. A. Warner, and W. C. Thompson.
Technical Bulletin No 87, 1974. 51 p, 16 fig, 8 plates, 3 tab, 4 ref, 3 append.

Descriptors: *Floods, *Flood damage, *Canada, Flood stages, Streams, Inflow, Rivers, Hydrographs, Precipitation(Atmospheric), Stream gages, Discharge(Water), Streamflow, Ice jams, Peak discharge.
Identifiers: *Peace River, *Alberta, Flood hydrographs, Maximum discharges, Agricultural damage.

Record flows in nearly all streams of the Peace River basin southwest of Grand Prairie followed more than 6 inches of rain in June 1972. Flood damage was reported in Grande Prairie, Grande Cache, Watino, and the town of Peace River. Calculations indicated that the influence of the W.A.C. Bennett Dam and diking operation in the town probably reduced the severity of flooding at Peace River townsite. The effect of the diking operation on water levels associated with an ice jam in April 1973 was discussed in an appendix. Details on agricultural flood damage incurred by farmers along the Peace River system were excerpted from 'Flood Damage Estimation, June 1972, Athabasca, North Saskatchewan and Peace River Basins' by J.L. Knapp, Alberta Department of Agriculture. Flood waters of the Smoky and Peace Rivers combined at Peace River townsite to produce a discharge of 550,000 cfs. The report gave a description of the flood, including meteorological analysis, flood hydrographs, and maximum discharges. Flood frequency analyses for two gage sites were presented. Hourly discharges were given for 7 sites and peak flows for two sites. (Roberts-ISWS)

FLOOD WATER ANALYSIS IN THE AREA OF THE TIDAL RIVER EIDER

(HOCHWASSERANALYSE IM RAUM DER BINNENEIDER),
E. Guevara-Perez, and U. Schendel.
Wasserwirtschaft, Vol 65, No 7/8, p 190-193, 1975. 1 fig, 4 tab, 14 ref.

Descriptors: *Storm water, *Rivers, *Flood forecasting, Floods, Mathematical models, Precipitation(Atmospheric), Data collections, Tidal streams.
Identifiers: Seasonal variations.

The probability of the occurrence of high water flows in the catchment area of the tidal river Eider (Schleswig-Holstein) was investigated by means of different distribution functions on the basis of observation data collected over eleven years. Three distribution functions: log normal distribution according to Galton; log Pearson type III distribution; and gamma distribution were found suitable for the forecasting of flood events. The occurrence of high water flows in the summer period is primarily determined by the precipitation two days and one day before the flood event, as well as on the day of the highest waters. The correlations between high water flow and the various parameters are less certain in the winter period, when high water flow is essentially influenced by the precipitation on the day preceding the event, by the water content of the ground, and by the precipitation on the day of the high water flow. CALIFORNIA HIGH WATER, 1973-1974,
California State Dept. of Water Resources, Sacramento. Div. of Resources Development.
W. A. Arvola, J. S. Bartok, W. B. Chan, J. C. Bringham, and G. W. Patrick.
Available from the Calif Dept of Water Resources, Sacramento, Calif, 95802 for $3.00. Bulletin No 69-74, November 1974. 67 p, 23 fig, 2 tab, 3 append.

Descriptors: *Floods, *Flooding, *California, *Water year, *Storms, Storm runoff, Runoff, Rainfall, Weather patterns, Precipitation(Atmospheric), Streamflows, Flood stages, Hydrographs, Flood damage, Hydrology, Reservoirs, Drainage.
Identifiers: High water events.

Water year 1973-74 in California was wet, especially in the northern part of the state. The wet season included two major storms that caused extensive flooding in several basins in the North Coastal Hydrographic Area, and in the Sacramento River basin of the Central Valley Hydrographic Area. The first major flooding occurred in mid-January 1974; the second occurred at the end of March 1974. The bulletin, 12th in an annual series of reports on high water events in California, presented information on flooded areas and storm-related damage during the water year (October 1, 1973-September 30, 1974). It described the general weather patterns preceding and during significant storm periods, the precipitation characteristics of these storms, and the resulting runoff. Also included were tabulations of precipitation comparisons, peak streamflows and stages, hydrographs of stream stages and reservoir operations, weir overflow graphs, and a description of general weather patterns significant to storms affecting California. (Robison-ISWS)

STILLWATER RIVER AND ROSEBUD CREEK FLOOD HAZARD ANALYSES, STILLWATER COUNTY, MONTANA.
Soil Conservation Service, Bozeman, Mont.
Report, May 1974. 132 p, 2 fig, 11 plates, 17 maps, 3 append.

Descriptors: *Floods, *Flood frequency, *Flood recurrence interval, *Montana, Rivers, Streams, Streamflow, Maximum probable flood, Flood forecasting, Flood data, Maps, Flood protection, Flood control, Flood damage, Flood plains, Flood plain insurance, Flood profiles, Surface runoff, Design flood, Erosion, Sedimentation, Hydrology, Management.
Identifiers: *Stillwater River(Mont), *Rosebud Creek(Mont).

Flooding results in loss of property, creates health and safety hazards, and disrupts needed services. Flooding also results in high costs to welfare agencies and city, county, state, and federal governments to repair or replace roads, streets, and bridges; rescue and care for the stranded; protect private property; clean up debris; and restore services. Knowledge of potential flood hazard, as presented in the report, is the basis of properly administering a flood plain management program to minimize these costs. The report contained sixteen aerial photomaps showing the 100-year frequency flood lines along a portion of the Stillwater River and Rosebud Creek. The photomaps also showed soils information. Water surface profiles, soils interpretations, flood photographs, and other related flood plain data were included. The 10-, 25-, 50-, 100-, and 500-year frequency floods were analyzed. Only the 100-year flood lines were shown on the aerial photomaps and water surface profiles. Information for the 10-, 25-, 50-, 100-, and 500-year floods was in an appendix. Elevations for other frequency storms can be determined from the basic support data on file with the Soil Conservation Service. (Sims-ISWS)

An appraisal is made of the role of geophysics in groundwater exploration and development, and the pertinent geophysical techniques and different hydrologic regimes to which they may be usefully applied are described. First the water-transmitting properties of the aquifer should be established; these are defined as either granular, or fractured, fissured, jointed or cavernous. The laternal extent of the aquifer should then be delineated and promising areas for well yield are approximated from observation well data. In mapping secondary aquifers the problem generally reduces to structural mapping of the aquifer and adjacent formations, whereas in hydrogeophysical mapping of primary aquifers the problem is one of delineating variations in those parameters which control groundwater quality and availability. Two potential problems can occur once development of an aquifer has taken place: overpumping resulting in declining water levels, and contamination if saline intrusion or the influx of polluted waters is induced. Both problems can be monitored by geophysical methods. (Robinett-Arizona)

GEOHYDROLOGY AND WATER QUALITY OF THE MISSISSIPPI RIVER ALLUVIAL AQUIFER, NORTHEASTERN LOUISIANA,
Geological Survey, Baton Rouge, La.
M. S. Whitfield, Jr.
Louisiana Department of Public Works, Water Resources Technical Report No 10, 1975. 29 p, 4 fig, 8 plate, 1 tab, 19 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Water quality, *Louisiana, *Mississippi River basin, Alluvial aquifers, Aquifer characteristics, Groundwater movement, Water wells, Well data, Pumping, Water yield, Transmissivity, Hydraulic conductivity, Storage coefficient, Groundwater recharge, Water supply, Chemical analysis.
Identifiers: *Northeastern Louisiana.

The Mississippi River alluvial aquifer in northeastern Louisiana is in the alluvium of the Mississippi, Arkansas, and Ouachita Rivers and underlies approximately 5,000 sq mi in the Mississippi River valley. The aquifer, of Pleistocene age, is a southeastward-thickening wedge of sand and gravel that ranges in thickness from about 20 to 135 feet. Fine sand, silt, and clay of Holocene age overlie and generally confine the aquifer. These fine-grained deposits range in thickness from 0 to 100 feet but generally do not exceed 40 feet. Water levels in the aquifer generally are less than 30 feet below land surface. The aquifer can yield water in sufficient quantity for most uses. The transmissivity ranges from 13,000 to 45,000 feet squared per day. The hydraulic conductivity ranges from 130 to 530 feet per day. Storage coefficients range from 0.001 to 0.05. Large-diameter wells yield as much as 7,000 gpm near Tallulah in Madison Parish. The quality of water varies areally and with depth, but generally the water is hard to very hard and high in iron concentration. Where fresh, the water typically is a calcium bicarbonate type generally ranging in hardness from 200 to 600 mg/litre. (Woodard-USGS)

THE HYDROLOGY OF A SMALL CATCHMENT BASIN AT SAMARU, NIGERIA: I. SEASONAL FLUCTUATIONS IN THE HEIGHT OF THE GROUND WATER TABLE,
Institute for Agricultural Research, Zaria (Nigeria).
J. Kowal, and A. O. Omolokun.
Samaru Res Bull. 149 p, 27-40. 1972. Illus.

Descriptors: *Watershed(Basins), Hydrology, Water table, Rainfall, Groundwater, *Seasonal, *Fluctuations.
Identifiers: Catchment basins, Nigeria, Production, Rainfall, Samaru, Seasonal, Small, Soil, Storage, Table, Water, Zaria, Nigeria.

Fluctuations of the water-table in a small catchment area at Samaru, Zaria, were studied. The water-table of the catchment basin occurs at various depths in relation to topography but can be described in terms of gradients in respect to topographical slope or a convenient horizontal datum (e. g., lake surface of full capacity). The dry season water-table occurs at a relatively shallow depth. The gradient of the dry season water-table restricts the water storage capacity of the soil profile, and in wet years not all the rainfall can be accepted. There is a considerable surplus of rainfall over evapo-transpiration demands lasting from July till the end of rains in Oct., resulting in the rise of water-table gradients. The rise in the dry season water table occurs when cumulative rainfall is about 18 in., which is usually in July. During wet years 40% of the catchment area has a water table at less than 5 ft depth when the rains end, and this may adversely affect crop production. With the present cropping patterns and the prevailing soil and climatic conditions, water conservation measures such as tired ridges cannot benefit crop production. The amount of ground water temporarily stored in the soil profile above the dry season water table and lost in seepage is between 10-14% of the total water budget of the catchment basin.--Copyright (c) 1974, Biological Abstracts, Inc.

Successful underground storage of large volumes of treated water (sufficient for a period of weeks or months) could provide a temporary, alternative water supply in areas where potable groundwater is not available and where surface runoff varies unpredictably in quantity and quality. A small-scale field test of underground storage, using an injection well, was performed in Jefferson Parish, Louisiana. Storage in the tested aquifer was impractical due to the pre-existing groundwater movement rate of 0.5 ft per day. A mathematical model of the injection-storage-production process accurately predicted the recovery efficiencies observed in the two tests. The quantity of injected water was not adversely affected by geochemical reactions occurring during the tests. The injected water was softened during storage by ion-exchange reactions between injected water and clay particles in the aquifer. (Sanderson-ISWS)

HYDROGEOLOGY OF A PORTION OF THE SAND HILLS AND OGALLALA AQUIFER, SOUTH DAKOTA AND NEBRASKA,
South Dakota School of Mines and Technology, Rapid City.
P. H. Rahn, and H. A. Paul.
Ground Water, Vol 13, No 5, p 428-437, September-October 1975. 10 fig, 2 tab, 15 ref.

Descriptors: *Hydrogeology, *Groundwater, *Aquifer testing, *Water table aquifers, *South Dakota, *Nebraska, *Groundwater recharge, Water quality, Recharge, Aquifer characteristics, Unsteady flow, Transmissivity, Hydraulic conductivity, Natural recharge, Storage coefficient, Drawdown, Water yield.
Identifiers: *Ogallala aquifer, Delayed yield, Type curve analysis, Well testing.

The Pliocene Ogallala Formation and the Quaternary Sand Hills Formation cover an extensive area in the northcentral prairie states. The area studied in this investigation included onlt that portion between the Little White River, South Dakota, and the Niobrara River, Nebraska, where the saturated thickness is about 100 feet. A five-day aquifer test showed that the coefficient of permeability is 439 gpd/sq ft. The water had total dissolved solids contents of only 90 ppm. An average of 18 inches of precipitation falls on this arid country annually, and the average annual recharge to these permeable deposits was calculated at 2 to 3 inches. Little groundwater development has occurred in the area to date, but the aquifer has considerable potential. The aquifer is exceptionally permeable, close to the surface, and easy to drill, and has exceptionally good recharge and good quality water. Data on recharge rates and theoretical distance-drawdown curves supported the conclusion that irrigation of more than 1 quarter-section for every 2 sections of land would cause a depletion of the aquifer. HIGH ELECTROLYTE WATER FOR RECLAIMING SLOWLY PERMEABLE SOILS,
Texas A and M Univ., College Station.
M. A. Rahman, E. A. Hiler, and J. R. Runkles.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 17, No 1, p 129-132, January-February 1974. 7 fig, 2 tab, 11 ref.

Descriptors: *Infiltration, *Infiltration rates, *Hydraulic conductivity, Electrolytes, Soil investigations, Soil management, Soil physical properties, Soil treatment, Soil water movement, Permeability, Agriculture, Analysis, Reclamation, Alkaline soils.
Identifiers: *Soil reclamation.

Reclamation processes in a slowly permeable, mildly sodic, low electrolyte, humid soil were studied using different ionic compositions and concentrations of electrolyte waters. The method utilized for this soil consisted of increasing soil hydraulic conductivity with additions in increasing concentration of electrolyte water and then leaching out salts with decreasing concentrations while maintaining the increased hydraulic conductivity. Electrolyte waters applied in increasing followed by decreasing concentrations were utilized successfully for reclaiming this soil. The soil intake rates and hydraulic conductivities were increased very substantially. Further applied research and field trials with similar soils seem justified based on the findings. MODELING INFILTRATION AND REDISTRIBUTION OF SOIL WATER DURING INTERMITTENT APPLICATIONS,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
L. G. James, and C. L. Larson.
Presented at 1974 Winter Meeting of the American Society of Agricultural Engineers, December 10-13, 1974. Chicago, Illinois Paper No 74-2571 American Society of Agricultural Engineers, St. Joseph, Michigan. 26 p, 17 fig, 2 tab, 22 ref.

Descriptors: *Model studies, *Computer models, *Infiltration, Soil water, Soil water movement, Wetting, Infiltration rates, Capillary action, Runoff, Irrigation, *Forecasting.

A model based on equations that use measured physical parameters to represent the infiltration and redistribution of soil water during intermittent water applications with reasonable simplicity and accuracy is needed. A computer model combining the work of other researchers was developed to fulfill this need. Inputs required by the model include the soil's saturated conductivity and moisture content, its approximate conductivity-

moisture content and conductivity-capillary pressure relationships, its initial moisture content as well as the distance from the soils' surface to its lower boundary. Model output includes the depths and moisture contents of both primary and secondary wetting fronts, the rates of infiltration, surface and subsurface supply as well as the total volume of water applied, infiltrated and supplied to surface and subsurface runoff. Experimental laboratory data for a graded silica sand was collected and compared to model predictions. Results presented indicate that the model does an excellent job of predicting the volume of water stored in the soil zone as well as the times when surface and subsurface runoff begin. It also gives excellent predictions of infiltration rate and surface and subsurface runoff supply rates when the application rate is less than or equal to the soils' saturated conductivity. (Skogerboe-Colorado State)

Descriptors: *Soil water, *Soil water movement, *Unsaturated flow, *Hydraulic properties, *Hydraulic conductivity, Drainage effects, Infiltration, Leaching, Soil physics, Moisture tension, Permeability, Soil types, Storage capcity, Moisture, Porosity, Soil moisture, Soil physical properties, Soil properties, Flow, Saturated flow, Measurement, Equations, Bibliographies.
Identifiers: Soil hydraulic properties.

Recent advances in developing methods to solve the equations governing combined saturated-unsaturated flow in 2 and 3 dimensions have focused attention on the need to determine effective field values of the hydraulic properties of the soil. Work done in this field to determine the field variability of soil hydraulic properties and to test various field methods of measuring these properties is discussed. Subjects include: methods for calculating the hydraulic conductivity from the soil water characteristics, thermal and osmotic effects on soil water movement, and transport equations of nitrogen movement during leaching of unsaturated soils. Journal of Geophysical Research, Vol 80, No 21, p 3044-1049, July, 1975. 8 fig, 9 ref.

Descriptors: *Soil temperature, *Soil surfaces, *Soil moisture, *Remote sensing, Moisture tension, Arizona, Topsoil, Soil physics, Soil water, Semiarid climates, Moisture content, Soil physical properties, Thermal properties, Air temperature, Diurnal, Soil types.

Experiments on Avondale loam soil indicate that remote sensing of surface soil temperature may provide a practical means of assessing soil water status in the uppermost few centimeters of bare soil. The volumetric water contents of surface soil layers between 2 and 4 cm thick were found to be linear functions of the amplitude of the diurnal surface soil temperature wave for clear day-night periods and also linear functions of the daily maximum value of the surface soil-air temperature differential. If the soil type is unknown, water content per se cannot be determined, but fair estimates of soil water pressure potential can be obtained. (Robinett-Arizona)

The percolation rates of nine typical southern Arizona soils were measured and found to vary from 1.75 to 21.5 cm/hr. Use of linear regression demonstrated a significant linear relationship between the test hole diameter and percolation rate, and correlation was found to exist between the percent of sand and clay in the subsoil and precolation rate. The percent of silt in the subsoil was also a factor in rate determination. A technique utilizing existing mathematical theories to simulate flow from cylindrical holes or absorption trenches in order to relate percolation rate to actual flow rates in absorption trenches was established but need improvement. Mathematical modeling does, however, provide potential for comparing percolation rates to expected flow rates. (McLachlan-Arizona)

CONTAINMENT AREA FACILITY CONCEPTS FOR DREDGED MATERIAL SEPARATION, DRYING, AND REHANDLING,
Hittman Associates, Inc., Columbia, Md.
C. W. Mallory, and M. A. Nawrocki.
Available from the National Technical Information Service, Springfield, Va 22161, as AD/A-002 605, $9.00 in paper copy, $2.25 in microfiche. Oct. 31, 1974. 236 p, 57 fig, 58 tab, 2 append.

Descriptors: *Dredging, *Sands, *Gravels, Reclamation, Spoil banks, Water pollution sources, Construction materials, Costs, Solid wastes, Bottom sampling, Desilting, Sludge disposal, Separation techniques, Soil engineering, Soil mechanics.

The separation of sand and gravel from dredged material is technically feasible using commercially available equipment employed by the sand and gravel and mineral processing industries. In most cases the cost of removing and processong the sand and gravel will be within the market value of materials normally produced. The removal of the sand and gravel will also reduce the required land area and storage volume of containment basins. (Witt-IPC)

SOIL WATER DEPLETION BY LODGEPOLE PINE ON GLACIAL TILL,
Intermountain Forest and Range Experiment Station, Ogden, Utah.
R. S. Johnston.
USDA Forest Service, Research Note INT-199, August, 1975. 8 p, 3 fig, 1 tab, 8 ref.

Descriptors: *Soil water, *Glacial soils, *Lodgepole pine trees, Clear-cutting, Water yield, Watershed management, Water resources, Groundwater availability.
Identifiers: Pinus contorta, Utah, Uinta Mountains(Utah).

Soil water depletion was measured on small paired plots of cut and uncut Pinus contorta. Neutron measurements were made to a depth of 3 m on two different soils of glacial origin. Soils on the cut plot contained from 3 to 11 cm more water than the adjacent uncut plot at the end of each summer after cutting. These changes in soil water were restricted to the surface 2 m of soil. The treatment effect should persist for several years, until deep-rooted vegetation is completely re-established on the site. ANALYTICAL SOLUTIONS TO THE ONE-DIMENSIONAL LINEARIZED MOISTURE FLOW EQUATION FOR ARBITRARY INPUT,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
A. W. Warrick.
Soil Science, Vol 120, No 2, p 79-84, August 1975. 2 fig, 2 tab, 12 ref, append.

Descriptors: *Equations, *Soil moisture, *Mathematical models, Infiltration, Percolation, Soil water movement, Diffusivity, Hydraulic conductivity, Gravitational water, Moisture content, Numerical analysis, Loam, Clay loam, Earth-water interfaces.
Identifiers: Linearized solution.

Analytical solutions to the one-dimensional, linearized moisture flow equation were presented. The surface boundary condition was taken either as a time-varying flux, time-varying water content, or with the flux as a linear function of the water content. A semi-infinite, vertical flow medium was considered with arbitrary initial conditions. Calculations for a cyclic flux input were compared to the associated nonlinear, finite difference solution for five simulations using data from two soils. The same general profiles were obtained. The solution was believed to have particular merit to describe moisture regimes resulting from a high frequency irrigation schedule. (Visocky-ISWS)

Identifiers: *Plane flow, *Axisymmetric flow, Trickle flow.

A simulation model for analyzing multidimensional simultaneous transfer of a noninteracting solute and water, applicable to infiltration from a trickle source, was developed. The equations describing transient two-demensional transport of a solute by diffusion and convection in unsaturated porous media were solved numerically by an approach that eliminated the effect of numerical dispersion. The noniterative alternating-direction-implicit finite difference procedure was used. Two mathematical models were considered: (1) a plane flow model involving the Cartesian coordinates x and z, and (2) an axisymmetric flow model described by the cylindrical coordinates r and z. An example of transport in a homogeneous, isotropic and stable sand and loam soil systems was given. Results were shown for typical cases of trickle infiltration to demonstrate the effects of trickle discharge and soil-hydraulic properties on the pattern of salt distribution in the wetted soil zone. The numerical results showed that the approach presented may be useful in analyzing two-demensional solute transport processes in soils. (Visocky-ISWS)

Descriptors: *Laboratory tests, *Soil moisture, *Moisture tension, Soil water movement, Soil structure, Soil surfaces, Moisture content, Measurement, Soil physical properties.
Identifiers: Suction plates, Pressure plates.

When wetting or draining structured soil material, particularly clods, on suction and pressure plates, interposal of a fine-grained material between sample and plate can be used to increase the efficiency of contact and hence the rate of transfer of water. The particle size range best suited to any given applied suction may be approximately determined using a theory of packing. It is found in most cases that material with a particle size range lying within the silt and fine sand fraction should suffice. Various materials - grinding powders, glass beads, diatomaceous earth and soil separates - were tested for moisture retention at suctions up to 10 bars. Overall the most readily prepared suitable material of those tested is a soil containing a high percentage of very stable aggregates in the size range 5 to 76 micrometers. At suctions less than 0.20 bar, diatomaceous earth is the most suitable of the materials tested. (CSIRO)

A HYDROPHOBIC MEMBRANE PROBE FOR TOTAL PRESSURE AND PARTIAL PRESSURE MEASUREMENTS IN THE SOIL ATMOSPHERE,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau, Hydrologie und Glaziologie.
H. Fluhler, and H. P. Laser.
Soil Science, Vol 120, No 2, p 85-91, August 1975. 8 fig, 13 ref.

Descriptors: *Soil environment, *Soil moisture, *Pressure measuring instruments, *Infiltration, Soil investigations, Soil water movement, Atmospheric pressure, Diffusion, Pore pressure, Measurement, Simulated rainfall, Instrumentation, Pressure, Aeration, Air, On-site investigations.
Identifiers: *Soil atmosphere, *Hydrophobic membrane probe, Oxygen partial pressure, Soil aeration, Total air pressure.

For total air pressure and oxygen partial pressure measurements a hydrophobic membrane probe was used. The probe consisted of a small membrane-covered chamber and two teflon capillaries. The probe represented an artificial, permanently air-filled pore which connects the soil atmosphere at a certain depth with a pressure transducer or an oxygen electrode placed on the soil surface. The soil water was excluded from the artificial gas phase by a water-repellent membrane highly permeable to air. The hydrophobic membrane made the gaseous phase between soil and sensor continuous. This instrument was used in the field to follow changes in total air pressure and oxygen partial pressure in the soil atmosphere during water infiltration and drainage processes. The total pressure in the soil atmosphere and the partial pressure of its components strongly depend upon the continuity of the gaseous phase. This effect was shown in an undisturbed soil profile after a heavy artificial rainfall of 75 mm was applied with 2 hr. (Sanderson-ISWS)

L. A. Sunde, and J. Barica.
Canada Fisheries and Marine Service, Research and Development Directorate Technical Report, No 510, 1975. 38 p, 5 fig, 8 tab, 13 ref, 1 append.

Descriptors: *Lake morphometry, *Geomorphology, *Climatic data, *Aquiculture, Fish farming, Canada, Shallow water, Land use, Precipitation(Atmospheric), Water temperature, Aquatic plants, Hydrologic aspects, Eutrophication, Winterkilling, Vegetation, Bathymetry, Potholes, Cold regions.
Identifiers: *Erickson-Elphinstone Dist.(Manitoba).

A systematic investigation was made of these shallow pothole lakes to determine their feasibility for commercial production of rainbow trout. The area is an undulating glacial till plain with underlying cretaceous shale of the Riding Mountain formation. Soils are 70% grey-black and 20% grey-wooded. Mean annual temperature is 1C with 85-110 frost-free days. Annual precipitation is 450-480 mm, snowfall 1140-1270 mm, potential evapotranspiration 525-550 mm, and mean moisture deficit about 100 mm. Grain and cattle are the principal resource bases. The land is 52% cultivated. Population density is about 3.5 people/sq km. Depressions between knolls and ridges are filled with marshes, sloughs, and pothole lakes. Because of the hummocky terrain and porous nature of unconsolidated glacial drift, surface drainage is local. Many lakes are landlocked with no surface inflow or outflow, very eutrophic, productive, shallow, and unstratified. Most winterkill and thus contain few native fish. Since 1968, 71 lakes have been experimentally stocked with rainbow trout with encouraging results. The lakes' area and depth frequency distribution is described. Bathymetric charts of 16 lakes are presented. These lakes are representative of hundreds of thousands of similar winterkill lakes in the Canadian prairies that are potentially suitable for fish farming. (Buchanan-Davidson--Wisconsin)

EXPERIMENTALLY INCREASED FISH STOCK IN THE POND TYPE LAKE WARNIAK. XII. NUMBERS AND BIOMASS OF THE FAUNA ASSOCIATED WITH MACROPHYTES,
Polish Academy of Sciences, Warsaw. Dept. of Hydrobiology.
E. Pieczynski.
Ekologia Polska, Vol 21, No 88, p 597-609, 1973. 4 fig, 5 tab, 50 ref.

Descriptors: *Fish stocking, *Grazing, *Aquatic plants, *Fish food organisms, Benthic fauna, Diptera, Invertebrates, Plant groupings, Animal groupings, Oligochaetes, Mayflies.
Identifiers: *Lake Warniak(Poland), Elodea canadensis, Stratiotes aloides.

Studies were made in Poland to estimate the food resources of the vegetation zone for fish and to study the effects of fish grazing on the invertebrate fauna associated with macrophytes. The number, biomass, and composition of fauna associated with two species of macrophytes found in distinctly monospecific aggregations were analyzed. More fauna were found on Elodea canadensis (water-weed) that on Stratiotes aloides (water-soldier), but the biomass of fauna and

number of components was lower. Numbers of Chironomidae, Oligochaeta, and Ephemeroptera and the biomass of Chironomidae and Ephemeroptera were high on Elodea. Numbers of Chironomidae and the biomass of Chironomidae, Hirudinea, and Lepidoptera were high on Stratiotes. Numbers and biomass were lower in comparison to the control portion of the lake which had an increased fish stock. Decreases in Chironomidae biomass were greater than changes in numbers; similar changes were observed in other fauna groups which could be used as fish food. Individual chironomids were lighter in the stocked part of the lake. These results appeared to be caused by fish grazing. (Buchanan-Davidson--Wisconsin)

Ecology. Vol 54, No 5, p 1164-1165. 1973. Illus.

Descriptors: *Salamanders, Animal populations, Biomass, Density.
Identifiers: Cryptobranchus Alleganiensis.

A tag-recapture study of the Ozark Hellbender salamander, C. alleganiensis bishopi, was made on the North Fork of the White River, Ozark Co., Missouri (USA). During the summers of 1969 and 1970, animals were tagged along a 2.67-km stretch of stream bed. Population estimates were 428 with 95% confidence level (CL) of 341-573 hellbenders/km of stream bed. Biomass estimates were 156 kg/km with 95% CL of 124.5-210 kg/km of stream bed. Density in 'prime habitat' was 1/8-1/3 m2 (with a 95% confidence interval of 1/6-7 m2-1/13-16 m2). Recaptures indicated little movement. Ozark Hellbenders are one of the dominant organisms in this stream system.--Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Boundary layers, *Viscosity, *Heat transfer, *Winds, *Laboratory tests, Interfaces, Velocity, Shear, Laminar flow, Turbulent flow, Surfaces, Measurements.
Identifiers: *Radiometric measurements, Velocity profiles.

Radiometric measurements have demonstrated the existence of a conductive sublayer in laboratory experiments at moderate air speeds. The viscous sublayer in water is thicker than the conductive sublayer. Information on the thickness of these sublayers at a water surface is necessary to measure ocean temperature and heat flow radiometrically. Profiles of velocity in the top millimeter of water in a wind-water tunnel were measured from cine photographs of clouds of microscopic hydrogen bubble tracers. The depth interval of 0.005 cm between measurements provided several velocity readings within the depth region in which a linear viscous sublayer might be expected. The linear portion of the velocity profile at the surface represented a viscous sublayer, which was thinner than that at a solid boundary with the same stress. This was believed to represent the first direct measurement of a viscous sublayer at a water surface. The viscous sublayer supports the previous evidence for a conductive sublayer sufficiently thick for radiometric heat flow measurements with moderate wind speeds. (Singh-ISWS)

Identifiers: Chemical balance, Uptake.

Mathematical solutions were given for an equation describing transient and steady state concentrations in lake water and sediments with adsorption, decay, sedimentation, and diffusion. The results were compared with the distributions of two tracers, Sr90 and Cs137, in the sediments of Lakes Erie and Ontario. Experimental data supported the treatment of adsorption of the tracers by sediment particles as a linear exchange reaction. Sr90 was adsorbed less strongly than Cs137 by the sediments. This accounted for the greater depth of Sr90 occurrence in lake sediments. Distribution of the radionuclide activities in sediments was compatible with a model based on mean steady input to the lakes for 16 years and these values of diffusion coefficients in the pore water: for Sr90, 0.000002 to 0.0000004 sq cm/sec; and for Cs137, 0.00002 sq cm/sec. Another transport mechanism in sediments, sedimentation, was more significant in Lake Erie than in Lake Ontario. Conditions were outlined under which the fluxes from lake water to sediments would be important in the chemical balance of medium and large lakes. (Adams-ISWS)

LIBRARY U. OF I. URBANA-CHAMPAIGN

Attention was drawn to the implications of adiabatic effects when examining the static stability of fresh water lakes. Although adiabatic effects are known to be small in lakes, especially near the temperature of maximum density, there is clearly a need to know just how small they are. A method was presented for finding potential temperatures in deep dimictic lakes. Though the adiabatic effect is very small it may be significant in special applications. (Lardner-ISWS)

ORGANIC ACID CHANGES IN THE EPIDERMIS OF VICIA FABA AND THEIR IMPLICATION IN STOMATAL MOVEMENT,
Agricultural Research Service, Watkinsville, Ga.
J. E. Pallas, Jr., and B. G. Wright.
Plant Physiol, Vol 51, No 3, p 588-590, 1973.

Descriptors: *Stomata, Organic acids, Plant physiology, Epidermis.
Identifiers: Vicia faba.

Considerable evidence indicates that the increase in guard cell turgor resulting in stomatal opening is brought about by active K+ uptake into guard cells. Only a small increase in inorganic anions appears to accompany the increase in K+. A plausible explanation is that organic acids are produced within guard cells and act as counterions, whereas the H+ produced are exchanged for K+. This hypothesis was tested by using different levels of ambient CO2 in light to control stomatal aperture and at the same time measure changes in organic acid production in the epidermis of V. faba. Epidermal strips were used, quickly frozen in liquid nitrogen, and later extracted. A positive correlation was found between stomatal resistance (r sub s, indirect measure of stomatal aperture) and CO2 level. With decreases in r sub s, total titratable acidity increased. The organic acids, glyceric, malic, and citric, in the epidermis, as measured by gas chromatography of trimethylsilyl derivatives, increased. Changes in glucose or sucrose were not found. These analyses provided evidence that organic acid production in the epidermis is associated with stomatal opening.--Copyright 1973, Biological Abstracts, Inc.

RELATIONSHIPS BETWEEN LEAF WATER STATUS, ABSCISIC ACID LEVELS, AND STOMATAL RESISTANCE IN MAIZE AND SORGHUM,
Department of Scientific and Industrial Research, Palmerston North (New Zealand). Plant Physiology Div.
M. F. Beardsell, and D. Cohen.
Plant Physiology, Vol 56, No 2, p 207-212, August, 1975. 7 fig, 1 tab, 30 ref.

Descriptors: *Plant growth, *Plant physiology, *Moisture stress, *Stomata, *Drought tolerance, Water requirements, Soil-water-plant relationships, Irrigation effects, Moisture deficit, Nutrient requirements, Osmotic pressure, Water balance, Turgidity, Corn(Field), Sorghum, Transpiration.
Identifiers: *Water potential, *Stomatal diffusion resistance, *Abscisic acid levels, Maize(Zea mays L. var. Wisconsin 575), Sorghum(Sorghum bicolor, hybrid NK145).

Water potentials, stomatal diffusion resistance, and abscisic acid levels were measured in the leaves of maize (Zea mays L. var. Wisconsin 575) and sorghum (Sorghum bicolor, hybrid NK145) plants subjected to a drought-recovery cycle under controlled environmental conditions. Over a narrow range of water potential (-8 to -10 bars), abscisic acid levels began to rise and the stomata closed. Abscisic acid levels continued to rise after the stomata closed. The maximum amount of abscisic acid extracted from maize leaves was about twice that from sorghum, and represented a similar proportional increase over the control level. It is concluded that stress response patterns in maize and sorghum are similar. Stomatal diffusion resistance and abscisic acid rise at slightly lower levels of leaf water potential in sorghum, which also appears to recover more rapidly upon rewatering. A lag of at least 60 minutes before an increase in abscisic acid level can be detected. maize indicates that a redistribution of endogenous abscisic acid rather than synthesis may be involved in the initial closure of stomata. paired stomatal functioning after stress does not appear to be associated with high residual levels abscisic acid in the leaf. 2J. Erosion and Sedimentation

NO-TILLAGE SYSTEM REDUCES EROSION FROM CONTINUOUS CORN WATERSHEDS,
Agricultural Research Service, Coshocton, Ohio.
L. L. Harrold, and W. M. Edwards.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 17, No 3, p 414-418, May-June 1974. 2 fig, 4 tab, 7 ref.

Descriptors: *Soil erosion, *Corn, Crop response, Crop production, Farm management, Climatic data, Rainfall-runoff relationships, Agriculture, Erosion, Erosion control, Erosion rate, *Sediment transport.
Identifiers: No-tillage management.

Soil erosion from seven large events on the two watersheds in the same conventional rotation cropped in the 1941-1969 period were sufficiently comparable to form a base on which to judge the effectiveness of the no-tillage system in the 1970-1973 period. Data for the period of identical treatment show little or no effect of land slope difference

12.7% and 5.8%. In the period of continuous corn, 1970-1973, erosion from the conventional tillage corn watershed remained high, while that from the no-tillage corn system decreased sharply. In 1973, differences in soil erosion were striking. Photographs taken after the July 10, 1973 event show signs of large amounts of sediment movement from the conventional tillage corn watershed. There was no evidence of sediment movement from the continuous corn watershed in the no-tillage system. (Skogerboe-Colorado State)

Descriptors: *Sediment yield, Idaho, Watersheds(Basins), Watershed management, Runoff, Stream erosion.

Information collected shows that a small percentage of yearly runoff produces most of the yearly sediment and that major floods occur during the winter. Contrary to what is normally observed, sediment concentrations and yearly sediment yield increased with watershed size. Stream bank erosion seemed to be the main source of sediment on the largest watersheds and 'channel flushing' caused high sediment concentrations. (Skogerboe-Colorado State)

Identifiers: *Sand textures, Multivariate discriminant-function analysis, Fluvial sands, Settling tube.

Multivariate discriminant-function analysis of settling-velocity (Psi) distributions of sands provides a reliable technique for environmental interpretation. Nearly complete environmental separation was achieved by this computational procedure using settling-velocity parameters for 81 samples of sand from desert dune, fluvial, and beach environments. The curve shape of sieved grain-size distributions plotted on probability paper does not appear to be a reliable guide for interpreting depositional environments. Comparison with settling-tube data indicates that sieving may distinguish grain-size distributions unrelated to the hydraulic characteristics of sediments and may not distinguish hydraulically important modalities. (Lee-ISWS)

EFFECTS OF AGRICULTURE ON EROSION AND SEDIMENTATION IN THE PIEDMONT PROVINCE, MARYLAND,
Denver Univ., Colo. Dept. of Geography.
J. E. Costa.
Geological Society of America Bulletin, Vol 86, No 9, p 1281-1286, September 1975. 5 fig, 2 tab, 41 ref.

Descriptors: *Erosion, *Sedimentation, *Maryland, *Deposition(Sediments), *Agriculture, Soil erosion, Sediment transport, Sediment load, Sediment discharge, Land use, Flood plains, Sediment yield, Reservoir silting, Hydrology.
Identifiers: *Sediment balance equation, Piedmont watershed, Sheetwash deposits, Stream-channel response, Reservoir sedimentation rate.

A study of surficial deposits in the Piedmont province of Maryland has made it possible to construct a balance equation of sediment production and deposition since erosive agricultural land use began in the 1700s. Truncated Piedmont upland soil profiles imply approximately 0.15 m of soil erosion. Reservoir sedimentation rates imply that 34% of the eroded sediment has been carried out of the system. The rest of the sediment remains in the watershed as alluvium in the upper 1 m of flood plains and as colluvium and sheetwash deposits on hillslopes. Agricultural sediment stored in flood plains constitutes 14% of the estimated soil erosion. The sediment was deposited mostly by overbank deposition at rates as high as 1.6 cm/yr. The remaining 52% of the eroded sediment occurs as colluvium and sheetwash deposits on hillslopes and as fan-shaped colluvial-alluvial deposits at junctures of headwater tributaries. Wood from such deposits was radiocarbon dated at 290 plus or minus 100 yr. A buried junk pile in a flood plain yielded license plates whose dates imply that after 1925 the dump was buried by overbank deposits at rates as high as those for a basin undergoing urbanization. Piedmont basins less than 26 sq km have statistically longer bankfull recurrence intervals than streams with drainage area greater than 25 sq km. This suggests that since the decline of agricultural land use in the early 1900s, small upland tributaries have adjusted to decreased sediment loads. (Lee-ISWS)

SPECIAL SOLUTIONS FOR NONLINEAR EROSION PROBLEMS,
Minnesota Univ., Minneapolis. School of Mathematics.
J. C. Luke.
Available from the National Technical Information Service, Springfield, Va 22161 as AD/A-001 360, $3.25 in paper copy, $2.25 in microfiche. Journal of Geophysical Research, Vol 79, No 26, p 4035-4040, September 10, 1974. 6 fig, 19 ref, 1 append. ONR N-00014-67-A-0094-0014.

Descriptors: *Erosion, *Sediment transport, *Weathering, *Model studies, Geomorphology, Streamflow, Soil formation, Sedimentation, Sediments, Sediment load, Suspended solids, Mathematical models, Flow, Fluid mechanics, Land forming.

A nonlinear system of differential equations was set up to describe evolution of landforms, and several previous models of weathering phenomena and sediment transport were found to follow as limiting cases. It was shown that an unexpectedly large class of nonlinear wavelike solutions can be obtained by the method of characteristics in certain cases. The geometry of the wave fronts was found by means of a Legendre transformation; this was equivalent to the study of solutions of constant form. The method was applied to a specific curved surface as an example, and the results were illustrated in several diagrams. Finally, a nonlinear stream formation problems was considered. (Sims-ISWS)

Journal of Soil and Water Conservation, Vol 30, No 4, p 173-176, July-August 1975. 2 fig, 3 tab, 8 ref.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Erosion, *Soil erosion, *Clays, Subsoil, Erosion rates, Simulated rainfall, Soil surfaces, Soil profiles, Soil properties, Construction, Erosion control, Soil management, On-site investigations.
Identifiers: *Construction site erosion, Soil erodibility, High clay subsoil, Soil loss.

Soil erosion rates on six high clay subsoils were measured during a series of simulated rainstorms. Soil erodibility factors computed for both tilled and scalped surface conditions differed appreciably from the K values predicted by the soil erodibility nomograph. K values for tilled subsoils were consistently smaller and those from scalped subsoils generally higher than the nomograph-predicted values. Deviations were attributed to the effects of aggregate size and stability. Scalped surface conditions were recommended as standards for evaluating subsoil erodibility. A soil management factor was used to describe soil erosion from other than scalped surfaces. (Lee-ISWS)

USE OF ERTS-1 IMAGERY TO INTERPRET THE WIND EROSION HAZARD IN NEBRASKA'S SANDHILLS,
Nebraska Univ., Lincoln. Conservation and Survey Div.
P. M. Seevers, D. T. Lewis, and J. V. Drew.
Journal of Soil and Water Conservation, Vol 30, No 4, p 181-183, July-August 1975. 4 fig, 8 ref.

Descriptors: *Winds, *Erosion, *Nebraska, *Remote sensing, Soils, Ranges, Satellites(Artificial), Sands, Soil erosion, Mapping, Land resources, Erosion rates, Range management, Vegetation.
Identifiers: *Wind erosion, *ERTS, Sandhills(Neb), Multispectral scanner.

Images from the Earth Resources Technology Satellite (ERTS-1) were interpreted for mapping areas in the Nebraska Sandhills where wind erosion had been severe and blowouts had formed and for mapping vegetative cover on rangeland to pinpoint places where future wind erosion was likely. Using images from May 1973 in the visible red wave length (MSS band 5), it was possible to construct maps showing blowout distribution. It was also possible, using the same images and a densitometer, to map areas where the range is in poor condition and vegetative cover so low that wind erosion is likely to occur. These maps will be useful in pinpointing areas in the Sandhills where range management practices need to be improved. (Lee-ISWS)

SEDIMENTATION IN LAKE LEMON, MONROE COUNTY, INDIANA,
Indiana State Dept. of Natural Resources Bloomington.
E. J. Hartke, and J. R. Hill.
For sale by Indiana Geological Survey, Bloomington, Indiana, 47401, for $1.00. Geological Survey Occasional Paper 9, 1974. 18 p, 14 fig, 4 tab, 4 ref.

Descriptors: *Lake sediments, *Storage capacity, *Sedimentation, *Suspended solids, *Indiana, Sampling, Hydrology, Lakes, Sedimentation rates, Sustained yield, Analysis, Sediments.
Identifiers: *Lake Lemon(Ind), Sediment samples.

The watershed hydrology, collection of sedimentation and water quality data, and analyses of these collected data were described for Lake Lemon, Monroe County, Indiana. Future sedimentation rate was predicted. The sedimentation rate in Lake Lemon was shown to be low, equal to 0.17% per year. The water in the lake had murky brown color with a vertical visibility of 6 to 12 inches in sunlight. Suspended sediment concentration near the surface was equal to 0.8 to 7.2 mg/l. The lake lost only 3.4% of the total capacity due to low sedimentation rate. With a present annual sedimentation rate of 0.17% it was estimated that the capacity of the lake would be reduced by half in about 290 years. (Bhowmik-ISWS)

GEOMORPHOLOGY OF A GLACIATED FIRST-ORDER VALLEY IN SOUTH CENTRAL NEW YORK,
Cornell Univ., Ithaca, N.Y. Dept. of Agronomy.
L. A. Daugherty, W. E. Hanna, and R. W. Arnold.
Soil Science Society of America Proceedings, Vol 39, No 4, p 710-716, July-August 1975. 6 fig, 2 tab, 9 ref.

Descriptors: *Soils, *Geomorphology, *New York, Valleys, Watersheds(Basins), Glaciation, Solifluction, Terraces(Geologic), Stratigraphy, Soil profiles, Soil surveys, Soil types, Erosion, Deposition(Sediments).
Identifiers: *Soil mapping, Periglacial, Congelitrubate, Soil morphology, Hillslope, Valley bottom.

A glaciated first order valley in south central Ne York was studied to determine the post glac evolution of the landforms. Ninety seven profi were sampled at depth intervals of approx mate 30 cm to determine internal features of the lan scape units. Particle size difference were the ma indicators of lithologic discontinuities. Arithmet mean of the fine earth particle size in conjuncti with the relative amounts and orientation of coar fragments were useful in determining strata of t summit, shoulder, backslope, footslope, toeslo and the high, intermediate, and low level terrace Congeliturbate as much as 10 m deep was found the basin at the head of the stream in foot a toeslope areas. The downstream portion of the deposits has been deeply entrenched by t stream. During periglacial times congeliturbate the downstream channel contributed to tempora base levels of the stream. Much of this congeliturbate remains as terraces. The alluvium resulti from the entrenchment of the congeliturbate o curs as a series of 92 terrace remnants. It is b lieved that their strata, relative elevation, a gradient contain clues to the complex sequence erosional and depositional events. (Lee-ISWS)

Available from the National Technical Inform tion Service, Springfield, Va 22161 as AD-A0 647, $4.50 in paper copy, $2.25 in microfich Technical Report No 13, December 1974. 61 p, 2 fig, 1 tab, 23 ref, 2 append. ONR 388-092/10-1 68(414). ONR N00014-69-C-0151.

Descriptors: *Lake Michigan, *Waves(Water *Erosion, *Sedimentation, Lakes, Sedimentar structures, Weather, Winds, Data collections, On site investigations, Beaches, Shores, Sand Beach erosion, Geomorphology, Currents(Water Limnology.

A 15-day time-series study was conducted simu taneously on both the east and west sides of Lak Michigan during the summer of 1974. Sites at Zion Illinois, and South Haven, Michigan, were in vestigated following the same procedures use during previous Lake Michigan studies. Primar objective of the study was to determine the natur of process-response activities as a single weathe system moves offshore and onshore as its crosse the lake. Only one low pressure system passe over the study area during the period of investiga tion. Observed patterns in the weather, waves, an currents were quite similar at both sites and wer similar to patterns from previous studies. I general, energy was higher on the east sid (onshore) as compared to the west side (offshore) The low intensity of the passing weather syste was reflected in the small amount of change to th beach and nearshore morphology. Increasing ener

gy caused erosion to the strand area and deposition in the plunge zone. During maximum energy conditions the plunge zone was eroded and deposition took place on the foreshore. Changes in processes and the topographic responses occurred simultaneously on both sides of the lake, at least within the limits of sampling intervals. (Sims-ISWS)

THE GEOCHEMISTRY OF SEDIMENTS FROM THE NORTHERN REYKJANES RIDGE AND THE ICELAND - FAROES RIDGE,
Texas A and M Univ., College Station. Dept. and Oceanography; and Texas A and M Univ., College Station. Coll. of Geosciences.
A. Horowitz.
Marine Geology, Vol 17, No 2, p 103-122, Sept, 1974, 4 fig, 3 tab, 46 ref.

Descriptors: *Analytical techniques, *Volcanoes, *Heavy metals, *Mineralogy, *Sedimentology, *Geochemistry, *Seismic studies, *Lead, *Iron, *Manganese, Copper, Chromium, Zinc.
Identifiers: *Geographical regions, Geochemical partition studies, Bulk chemical analyses, Iceland, Atomic absorption spectroscopy, X-ray diffraction, *Lithium.

Samples from active Reykjanes Ridge and the inactive Iceland - Faroes Ridge have been investigated sedimentologically, mineralogically, and geochemically. The sediments display polymodal grain-size distributions and are poorly sorted, indicating deposition by various mechanisms and contributions from numerous sources. The mineralogy strongly reflects the large input of volcanic ash and ice rafted material. Bulk chemical analyses indicate the Reykjanes Ridge sediments appear to be enriched in Fe, Mn, Cu, Cr, and Zn as has been reported for other active ridges. Faroes Ridge in Iceland does not show this enrichment. Partition studies indicate that enriched Fe and Mn ore are held in separate phases while the other metals are present in all phases. Adsorption are not in major concentrating mechanism for the enhanced elements. Li distributions are apparently unaffected by active ridges and Pb seems to be partially concentrated biologically. There are indications that other criteria must be used in conjunction with bulk chemical analyses, in order to establish the presence of active ridge metal contributions. (Kemp-Vanderbilt)

Descriptors: *Heavy metals, *Mercury, *Iron, Pollutants, *Oxidation, Mine water, Chlorine, Hydrogen ion concentration, Spectrophotometry, Solubility, Water pollution, Chemical properties, Isotope studies, Mining.
Identifiers: *Cinnabar, *Soluble mercury, Chemical binding, *Isotopic dilution, *Oxidation ate, New Almaden Mine.

A laboratory study was set up to determine the ate of oxidation of cinnabar (HgS) by Fe (III) and he release of mercury to solution under conditions prevalent in acid mine drainage waters. esults show that under certain conditions significant mercury was released to solution. This occured when both Fe (III) and C1(-) were present in solution at environmental levels with a low pH. However, when a large amount of cinnabar was present, most of the mercury released to solution became bound to the cinnabar by an unknown mechanism. For this reason the amount of dissolved mercury was much lower than expected given the high rate of oxidation of cinnabar. An isotopic dilution method was used to calculate the total mercury, both in solution and bound to the remaining cinnabar, released by oxidation. Total iron and soluble mercury were measured by atomic absorption. Chloride was measured by argentometric and mercuric nitrate methods. (Davis-Vanderbilt)

THE EFFECT OF TEXTURE STRATIFICATION ON SALT ACCUMULATION IN AN ARID LAND SOIL,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
A. K. Abbass.
Master of Science Thesis, 1974. 53 p, 12 fig, 9 tab, 32 ref.

Descriptors: *Groundwater movement, *Saline soils, *Saline water, *Soil profiles, *Stratification, Groundwater, Soils, Soil properties, Salinity, Soil structure, Sands, Arid lands, Clays, Irrigation effects.

A laboratory soil-column experiment was conducted to study the effect of saline groundwater and soil stratification on salt distribution in soil profiles under fallow condition. In general, the column surfaces of the stratified soils were significantly higher in salt than the homogenous sand and clay soils, due to the upward movement of saline groundwater through the soil column and evaporation at or near the surface. The major ions contributing to the surface salts were Na+, Ca++,and Cl-. The salt in the clay soil columns was higher in Ca++ concentrations and lower in Na+ than in the sandy soil. (McLachlan-Arizona)

TOTAL ALKALINITY AND HARDNESS OF SURFACE WATERS IN ALABAMA AND MISSISSIPPI,
Auburn Univ., Ala. Dept. of Fisheries and Allied Aquacultures.
C. E. Boyd, and W. W. Walley.
Alabama Agricultural Experiment Station, Bulletin 456, March 1975. 16 p, 4 fig, 6 tab, 28 ref.

Descriptors: *Alkalinity, *Hardness(Water), *Productivity, *Alabama, *Mississippi, Ponds, Streams, Surveys, Geomorphology, Fish harvest.

Studies of small ponds and streams from major physiographic divisions of Alabama and Mississippi showed that total alkalinity was closely related to the nature of surface and subsurface geologic formations. Stream waters generally had higher total alkalinity and total hardness than pond waters. During low flow, streams consisted primarily of ground water which was normally concentrated in ions than runoff. Ponds were usually filled by direct precipitation and runoff thus contained lower ionic concentrations. There was usually a high correlation between total alkalinity and total hardness, which were derived from solutions of calcium and magnesium carbonates in most physiographic areas. When total hardness greatly exceeded total alkalinity, sulfate ions were more abundant. Sodium and potassium were associated with alkalinity anions, where alkalinity greatly exceeded hardness. Calcium was more abundant than magnesium in all waters. Correlations between total hardness and calcium hardness were high for all waters. Correlations between alkalinity and productivity were related to differences in phosphorus and nitrogen concentrations rather than alkalinity. Phytoplankton growth in ponds with low total alkalinity or hardness may be limited by low carbon dioxide or bicarbonate and calcium and should be limed to increase carbon availability for photosynthesis, supply calcium to enhance fish production. (Buchanan-Davidson--Wisconsin)

QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1969: PART 2. SOUTH ATLANTIC SLOPE AND EASTERN GULF OF MEXICO BASINS.
Geological Survey, Reston, Va.
Supt. of Documents, GPO, Wash., D.C. 20402 Price $4.35 (paper copy). Water-Supply Paper 2142, 1974. 625 p, 1 fig, 40 ref.

Descriptors: *Water quality, *Surface waters, *Sediment transport, *Water temperature, *Southeast US, River basins, Atlantic Ocean, Gulf of Mexico, Basic data collections, Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, Virginia, Physical properties, Streamflow, Sampling, Sites.
Identifiers: *South Atlantic Slope, *Eastern Gulf of Mexico.

During the water year ending September 30, 1969, the Geological Survey maintained 152 stations on 103 streams in the South Atlantic slope and Eastern Gulf of Mexico basins for the study of chemical and physical characteristics of surface water. Samples were collected daily and monthly at 140 of these locations for chemical-quality studies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 33 and daily at 55 stations. Daily water temperatures were measured at most of the stations at the time samples were collected for chemical quality or sediment content. So far as practicable, the water temperatures were taken at about the same time each day. Quantities of suspended sediment are reported for 8 stations during the year ending September 30, 1969. Sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. The stream discharge reported for a composite sample is usually the average of daily mean discharges for the completion period. The discharges reported in the tables of single analyses are either daily mean discharges or discharges obtained at the time samples were collected and computed from a stage-discharge relation or from a discharge measurement. Identifiers: Lake Evergreen(Ill), Water chemistry changes, Six-Mile Creek(Ill), Chemical parameters, Biological activity.

Lake Evergreen was investigated during the time of filling and thereafter for changes of water chemistry at the mud-water interface. The results showed that aging or maturing occurs at the nascent stage of the impoundment history. There are many factors affecting concentration of chemical constituents at the interface. Hydrologic changes such as wind and wave action or water circulation can influence all chemical parameters. Biological activity may involve changes in concentrations of silica, phosphate, alkalinity, pH, ammonium, Kjeldahl nitrogen, etc. An associated effect is the reduction of oxidation-reduction potential which in turn affects the concentration of manganese, etc. All these changes occur primarily in autumn. In late spring to summer, there are changes of nitrite and nitrate accompanied by changes in dissolved oxygen. A water chemistry model at the interface was illustrated. (Henley-ISWS)

BIOGEOCHEMISTRY OF MARSH GASES: EFFECTS OF INORGANIC CONSTITUENTS OF MARSH PLANTS ON METHANE EVOLUTION; AND CARBOHYDRATE STABILITY IN PLANTS,
Delaware Univ., Newark. Coll. of Marine Studies.
F. M. Swain, J. M. Bratt, and J. Sherman.
Technical Report No 30, November 1974. 14 p, 2 fig, 2 tab, 11 ref.

Descriptors: *Evolution, *Marsh plants, *Methane, *Inorganic compounds, Marshes, Gases, Carbohydrates, Alcohols, Humus, Cellulose, Organic acids, Delaware, Microbial degradation.
Identifiers: Succulent plants, Salicornia, Distichlis.

Inorganic components of several species of marsh plants were studied to determine how they relate to methane evolution. Salt-marsh plants showed a relationship between succulence and methane production. The most succulent plants such as Salicornia and Distichlis contributed to relatively low methane evolution Potassium chloride accumulation was high in both plants while sodium and magnesium concentrations were low. The total carbohydrate, the cellulose content of plants cultivated for methane production, and the cellulose content of the supernatant water were studied. The cellulose content of the culture was reduced to traces after several weeks although methane was still produced in high concentrations. Methane-producing bacteria developed best on cellulose substrates, but continued to grow on other carbohydrates. An intermediate stage in the anaerobic digestion of organic matter is the formation of organic alcohols and acids and followed by conversion to methane and carbon dioxide. The degree to which organic acids, alcohols, and other carbohydrate degradation products remain in the environment or are used for further bacterial degradation should be studied in Delaware marshes as they may be important in food chains and may be seasonal. Evaporation of the products may be involved in aerosols that develop in coastal regions. (Buchanan-Davidson--Wisconsin)

SPECIES COMPOSITION, STANDING STOCK, AND NET PRIMARY PRODUCTION OF A SALT MARSH COMMUNITY IN MISSISSIPPI,
Mississippi State Univ., Mississippi State. Dept. of Zoology.
B. C. Gabriel, and A. A. de la Cruz.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-74-11816, $3.50 in paper copy, $2.25 in microfiche. Publication MSGP-73-020, June 1974, 8 p, 2 fig, 2 tab, 11 ref. (NOAA-74111308). Published in Chesapeake Science, Vol 15, No 2, p 72-77, 1974.

Descriptors: *Productivity, *Salt marshes, *Marsh plants, Standing crops, Mississippi, Biomass, Bulrushes, Vegetation, Plant growth, Varieties, Estuaries, Harvesting.
Identifiers: St. Louis Bay Estuary(Miss), Juncus roemerianus, Spartina cynosuroides, Distichlis spicata, Scirpus americanus.

Increases in above ground biomass during the growing season of a vegetationally mixed marsh in St. Louis Bay Estuary, Mississippi, were used to estimate species composition, standing stock, and annual net production. Thirty-four species from eleven taxonomic families of marsh plants were identified. Needlerush Juncus roemerianus, giant cordgrass Spartina cynosuroides, bulrush Scirpus americanus, and salt grass Distichlis spicata were the dominants. The other thirty species occurred only occasionally and did not represent the entire flora of the estuary. Diversity was probably due to variation in salinity. Maximum biomass of alive, dead, and partially decayed plants were observed in July, August, and January, respectively; minimum biomass of alive plants was observed in January. Standing dead biomass was always about the same. Community annual net production estimated by harvest method was 1051 g dry wt or 5012 ash-free Kcal/sq m. Total biomass obtained by reharvesting previously clipped quadrats in various stages of regrowth revealed a seasonal pattern of growth rate with a maximum during late summer and a productivity estimation of 1108 g dry wt or 5541 ash-free Kcal/sq m. (Buchanan-Davidson--Wisconsin)

PROPAGATION OF SPARTINA ALTERNIFLORA FOR SUBSTRATE STABILIZATION AND SALT MARSH DEVELOPMENT,
North Carolina State Univ., Raleigh.
W. W. Woodhouse, E. D. Seneca, and S. W. Broome.
Available from the National Technical Information Service, Springfield, Va 22161 as AD/A-002 055, $6.75 in paper copy, $2.25 in microfiche. Army Coastal Engineering Research Center TM-46, August 1974. 155 p, 61 fig, 44 tab, 43 ref. DACW72-70-C-0015, DACW72-72-C-0012.

Descriptors: *Marsh plants, *Planning management, *Spoil banks, *Intertidal areas, Vegetation establishment, Salt marshes, Nutrient requirements, Slope stabilization, North Carolina, Estuaries.
Identifiers: Spartina alterniflora.

Stabilization of dredged material in the intertidal zone by establishment of an estuarine marsh plant--Spartina alterniflora (smooth cordgrass)--are described Transplants were more vigorous seedlings and survived on exposed sites at le elevations. They should preferably be plante April and May 0.9 m apart; but have lim growth for the first season Seedlings and s are less tolerant of rigorous conditions and usually only effective in upper one-half of el tion range of S. alterniflora Mature seeds stor 2-3C in salt water and planted 100 viable seed m in the upper 1-3 cm of substrate grew ra and usually produced better cover than transp in the first season. Selecting sites at proper el tions for growth is critical. Stands resisted petition from invading plants in areas of salinity and long periods of inundation. Vari negatively associated with yield were sali manganese, and sulfur, while phosphorus positively associated with yield. Nitrogen phosphorus fertilizers enhanced growth of t plants and seedlings artificially establishe dredge spoil. Salt marshes may be importa recycling nutrients that might otherwise occ estuarine pollutants. (Buchanan-David Wisconsin)

Geol Mijnbouw. Vol 52, No 4, p 193-202. Illus.
Identifiers: Chenier, Coasts, *Estuaries, *Fa Formation, *Holocene transgressions, Mar Mollusks, Peat, Seams, *United Kingdom(Th estuary), *Halocene regressions, Radiocarbo ing.

Faunal and lithological changes within the 34 Holocene sediments of the chenier plain sugg episodes (I-VI) of marine transgression i spersed with 5 episodes of regression. Evid presented for recognizing transgressions inc chenier formation, marsh retreat and ve changes in fauna, involving brackish water a tertidal mollusks. Regressions are interp chiefly from geosols and peat seams. Radioca dates indicate that the transgressive episod III and V first affected the region at about 4000 and 1400 B. P., respectively. The most r one (VI) probably commenced about 300 B. P dates of episodes I and IV can only be co tured. Comparison with similar events global well as in the Low Countries suggests that eu changes in sea level have played a significan in the Holocene history of the Outer Th estuary.--Copyright 1974, Biological Abstr Inc.

Stretching deformation rates, Lagrangian observations.

Observations of the motions of drifter clusters were made in the western Caribbean Sea during the summer of 1971. By two independent analyses of the relative motions of a cluster, two time series of horizontal divergence, vorticity, shear deformation rate, and normal deformation rate were developed. The results of the two approaches were very similar. The time series for these differential kinematic properties were fairly smooth when the drifters were moving in the Yucatan Current. Otherwise, the time series were ragged with frequent changes in sign. It was speculated that the raggedness is due to small values of the shear rates relative to random observational errors or small-scale turbulent processes. The records of the differential kinematic properties were used to evaluate the stretching and material derivative terms of the vorticity equation. Calculations indicated that potential vorticity is conserved along trajectories in the Yucatan Current. (Sims-ISWS)

HORIZONTAL COHERENCE OF TEMPERATURE MICROSTRUCTURE,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia).
A. A. Elliott, and N. S. Oakey.
Journal of Physical Oceanography, Vol 5, No 3, p 506-515, July 1975. 11 fig, 9 ref.

Descriptors: *Oceans, *Temperature, *Thermal properties, *Atlantic Ocean, Internal waves, Sampling, Data processing, Correlation analysis, Oceanography.
Identifiers: *Temperature microstructure, Denmark Strait, Horizontal coherence.

Temperature gradient records from vertical lowering of an array of four thermometers were used to trace microstructure features horizontally over a distance of 46 cm. Identifiable features were found to have a slope and a vertical velocity or curvature with a statistical distribution similar to that expected from an internal wave field superimposed on horizontally-layered microstructure. The horizontal extent of microstructure with a vertical scale greater than 5 cm was at least an order of magnitude greater than its vertical scale. (Sims-ISWS)

ALONGSHORE COHERENCE AT LOW FREQUENCIES IN CURRENTS OBSERVED OVER THE CONTINENTAL SHELF OFF OREGON AND WASHINGTON,
Department of the Environment, Ottawa (Ontario). Ocean and Aquatic Affairs.
A. Huyer, B. M. Hickey, J. D. Smith, R. L. Smith, and R. D. Pillsbury.
Journal of Geophysical Research, Vol 80, No 24, p 3495-3505, August 20, 1975. 9 fig, 6 tab, 15 ref. NSF ID071-04211, ERDA AT (45-1)-2225.

Descriptors: *Ocean currents, *Continental shelf, *Pacific Ocean, *Pacific Northwest U.S., Continental slope, Coasts, Currents(Water), Ocean circulation, Winds, Current meters, Flow measurement, On-site investigations, Sea level, Regression analysis, Oceanography.
Identifiers: *Current observations, Spectral analysis, Coherence.

Current observations over the continental shelf at locations off central Oregon and southern Washington had the period from July 18 to September 18, 1972, in common. Low-frequency fluctuations (less than one cycle per day) in the currents were compared by means of visual display, linear regression, and spectral analysis. The currents were highly coherent over an alongshore separation of 200 km. Coherent signals occurred at 0.16, 0.3, and 0.44 cpd. The signal at 0.16 cpd occurred with high mutual coherence in wind, current, and sea level and may be a forced shelf wave driven by the wind. The signal at 0.3 cpd had high coherence between current and sea level and may be a free shelf wave generated by the wind. Correlation between observations was higher for separations in the alongshore direction than in the offshore direction in spite of greater separations. (Sims-ISWS)

MULTIPLE OFFSHORE BARS AND STANDING WAVES,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
A. D. Short.
Journal of Geophysical Research, Vol 80, No 27, p 3838-3840, September 20, 1975. 4 fig, 1 tab, 13 ref.

Descriptors: *Coastal engineering, *Waves(Water), *Standing waves, Shores, *Sedimentation, *Sand bars, *Alaska, Winds, On-site investigations, Sediment transport, Currents(Water), Geomorphology.
Identifiers: *Offshore bars, Progressive waves.

Field measurements of multiple offshore bar spacing were compared to theory and wave measurements to corroborate the suggestion that bar formation an spacing are controlled by standing waves in the infragravity range (0.5-5 min). Theoretical and experimental studies predicted the reflection of progressive waves from a shoreline as standing waves. Associated drift in the bottom boundary layer was expected to produce sediment accumulation and bar formation under either the nodal or the antinodal points. Measurements of waves in the infragravity spectrum confirmed the occurrence of such standing waves, and spacing of offshore bars in adjacent areas correlated well with the predicted position of the bars. SEDIMENTATION OF ORGANIC MATTER IN ST. MARGARET'S BAY, NOVA SCOTIA,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Marine Ecology Lab.
T. J. M. Webster, M. A. Paranjape, and K. H. Mann.
Journal of the Fisheries Research Board of Canada, Vol 32, No 8, p 1399-1407, August 1975. 5 fig, 2 tab, 25 ref.

Descriptors: *Sediments, *Organic matter, *Inorganic compounds, *Canada, Food chains, Suspended solids, Seashores, Bays, Phytoplankton, Fish eggs, Sedimentation rates, Runoff, Bottom sediments, Detritus, Sampling, Analysis, Carbon, Kelps, Aquatic plants, Aquatic productivity.
Identifiers: *Sediment traps, *St. Margaret's Bay(Canada), *Nova Scotia, Seaweeds, Seagrasses.

Sediment traps were placed at two sites in St. Margaret's Bay. At a deep station (70m), traps were placed 5m and 10m above the bottom; at a shallow station (10m), six traps were placed between 45 and 197 cm above the bottom. Total catch averaged 118g carbon per sq m per yr at the deep station and 134g carbon per sq m per yr at the shallow station. The most probable source of the organic matter was detritus derived from seaweeds and seagrasses, but the most probable source of inorganic material was bottom sediment. It was suggested that the traps were taking bottom sediment resuspended from shallow water, enriched by detritus from seaweeds and seagrasses. (Lee-ISWS)

Effects of outflow inertia, turbulence, bottom friction, buoyancy, and marine forces to river mouth

LIBRARY U. OF I. URBANA-CHAMPAIGN

outflow dynamics and sediment deposition vary. Effluent behavior varies significantly with river stage and between 4 dynamic regions. During low and normal river stages, when a salt wedge intrudes into the distributary channel, Region I, which extends from the mouth to about 4 channel widths seaward, is characterized by buoyancy-dominated lateral effluent expansion, vertical thinning, and vertical saltwater entrainment. In Region II, which is situated over the distributary-mouth bar crest, the density interface approaches closest to the surface, densimetric Froude numbers attain maxima, internal waves break, and intense mixing occurs. Region III, approximately between 6 and 10 channel widths seaward of the mouth, is characterized by an internal hydraulic 'jump' in which densimetric Froude numbers decrease to subcritical values and the depth of the density interface increases. In Region IV, extending about 10 channel widths seaward of the mouth to the seaward limits of the effluent, densimetric Froude numbers are subcritical; the surface effluent expands under the influence of buoyancy and is subject to mixing by marine forces. When the river is flooding, the salt wedge is flushed seaward beyond the bar crest; turbulent mixing, strong bottom shear, and seaward bed-load transport prevail throughout Region I. Under these conditions, the effects of buoyancy are weak. Throughout most of the year, the combined effects of effluent buoyancy and saltwater entrainment create lateral convergence of flow near the bottom and beneath the effluent. (Sims-ISWS)

MASS MOVEMENT OF MISSISSIPPI RIVER DELTA SEDIMENTS,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
J. M. Coleman, J. N. Suhayda, T. Whelan, and L. D. Wright.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-001-588, $3.50 in paper copy, $2.25 in microfiche. Proceedings, Gulf Coast Association of Geological Societies, Lafayette, Louisiana, p 49-68, October 1974. 21 fig, 36 ref. ONR NR-388-002, ONR N00014-69-A-0211-0003.

Descriptors: *Mississippi River, *Deltas, *Sediments, Geology, Geomorphology, Deposition(Sediments), Sediment load, Sedimentology, Faults(Geologic), Fractures(Geologic), Folds(Geologic), Marine geology, Estuaries, Continental shelf.
Identifiers: *River mouths, Depositional patterns, Peripheral slumping, Clay flowage.

River-mouth depositional patterns are modified by sediment deformational processes of a magnitude to endanger bottom-supported structures, including: (1) peripheral slumping, (2) differential weighting and dispirism, (3) radial tensional faulting, (4) mass wasting and flowage induced by wave motion and degassing, and (5) deep-seated clay flowage. High depositional rates occur near the river mouth and decrease seaward, and with time the bar oversteepens; rotational slump planes form peripheral to the bar front, moving sediment into deeper water. Differential loading by denser bar sands overlying low-density dlays results in vertical and seaward flowage of the clays along with seaward bar progradation. Diapiric folds and spines (mudlumps) intrude into delta-front sediments on the seaward side of the deforming load. The seaward extrusion and continued movement of clays arch the overlying delta-front sediments. A stress relieved by small graben faults oriented radial to the deforming load or delta lobe. The finer grained river-mouth sediments contain high percentages of methane and CO2 gases. Passage of hurricane waves produces bottom pressure perturbations, forcing the entrapped gas upward, causing loss of sediment strength and allowing subaqueous mass movement to occur. The weight of the modern delta has depressed underlying Pleistocene sands some 120 meters, causing squeezing and flowage of clays onto the continental shelf at water depths greater than 150 meters. (Sims-ISWS)

COASTAL DYNAMICS ON CEDAR ISLANDS, VIRGINIA,
University of South Florida, Tampa. Dept. of Geology.
R. A. Davis, Jr., and W. T. Fox.
Available from the National Technical Information Service, Springfield, Va 22161 as ADA-001-068, $4.50 in paper copy, $2.25 in microfiche. Report USF-11, June 1, 1974. 66 p, 32 fig, 21 ref, 2 append. NR 388-092, ONR N00014-69-C-0151.

Descriptors: *Fourier analysis, *Meteorological data, *Waves(Water), *Currents(Water), *Virginia, Geomorphology, Coasts, Beaches, Winds, Tides, Groundwater, Breakwaters, Environmental effects, Model studies, Computer modesl, Atmospheric pressure, Time series analysis.
Identifiers: *Swell waves, Morphologic variables, Coastal processes, Cedar Islands(Va), Wave energy.

A time studies of coastal processes and morphologic responses was conducted during July 1973 on Cedar Island, Virginia. Patterns exhibited by variations in monitored environmental variables showed interrelationships that are quite comparable to those observed in previous similar studies on Lake Michigan and the central Texas coast. As in previous studies, barometric pressure fluctuations appeared to be the key to controlling other processes. Long period swell waves provided the controlling mechanism when they were present in that they caused total wave refraction and no significant longshore currents were present. The combination of a moderate tidal range (6 feet) and longshore bars caused marked effects on coastal processes such as breaker height and longshore currents. Where longshore bars were absent there was no apparent effect of tidal stage on other coastal processes operating on the beach and in the surf zone. (Lee-ISWS)

Identifiers: Backwash, Uprush, Swash marks, Unidirectional flow.

Investigation of the sediment transport of uprush and backwash of a single surge cycle was made. Direct observation indicated that for the main body of the fluid, accelerating or decelerating unidirectional flow is a reasonable characterization. The uprush, initially a bore, then a surge over a 'dry bed', has traditionally been considered to be so complicated as to defy characterization of the internal flow. However, it was shown that the uprush may be divided into two distinct portions, the leading portion (the tongue) characterized by extreme turbulence and with a high proportion of sediment in suspension and in traction. The remainder of the uprush and the whole of the backwash may be regarded as decelerating or accelerating unidirectional flow, exhibiting the expected but transient sequential bedform featur
It appears that analysis of the bedform mechan
is feasible using unidirectional flow metho

CLASSIFICATION OF MODELS OF TID WATERS,
Monash Univ., Clayton (Australia). Dept. Mechanical Engineering.
J. B. Hinwood, and I. G. Wallis.
Journal of the Hydraulics Division, Ameri Society of Civil Engineering, Vol 101, No HY Proceedings Paper 11643, p 1315-1331, Octo 1975. 1 tab, 141 ref, 1 append.

Descriptors: *Mathematical models, *Ti waters, *Tidal effects, *Estuaries, *Hydraul *Waste disposal, Dispersion, Model stud Simulation analysis, Water quality, Path of po tants, Mixing, Waste water disposal, Water po tion.
Identifiers: *Temporal averaging.

A classification scheme was presented for num cal models of water and waste movement in t bays and estuaries. The classification was ba on the number of spatial dimensions, the refere frame used, temporal resolution obtainable, the degree to which hydrodynamic processes included. Newly developed models can easily fitted into the scheme. With this classificat scheme, different models may be assessed compared on the basis of their theoretical assu tions. To select a model for a particular tas sequence of questions may be answered and f the answers the appropriate type of model may selected. The classification table then indicates models available to meet the requirements of particular physical situation. (Lardner-ISWS)

C. Mason.
Available from the National Technical Infor tion Service, Springfield, Va 22161 as AD-A 778, $3.50 in paper copy, $2.25 in microfiche. J nal of the Waterways, Harbors and Coastal gineering Division, American Society of Civil gineers, Vol 99, No WW3, Proceedings Pa 9952, p 393-397, August 1973. 1 tab, 8 ref, 2 pend.

Descriptors: *Channels, *Tidal wat *Inlets(Waterways), Hydraulics, Harbors, Fl Flow characteristics, Regime, Tides, Tidal effe Equations, Shores, Estuaries.
Identifiers: *Regime theory.

Selected regime equations for stable channel cross-sectional areas were compared to an empirical relationship for stable tidal inlet areas. Using an equivalent steady discharge to represent the tidal flow, good agreement was exhibited between the most generalized regime and a tidal prism versus area formula. Although the controlling hydraulic conditions in each case are distinctly unique, the agreement appeared to be more than fortuitous. (Sims-ISWS)

CURRENT RELATED TO SEDIMENT TRANSPORT AT THE IBERO-MOROCCAN CONTINENTAL SHELF,
Woods Hole Oceanographic Institution, Mass.
G. Siedler, and E. Seibold.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A002 400, $3.50 in paper copy, $2.25 in microfiche. Report WHOI-74-86, November 1974. 12 p, 9 fig, 4 tab, 26 ref. ONR N00014-66-C0241.

Descriptors: *Sediment transport, *Continental shelf, *Ocean currents, Currents(Water), Measurement, On-site investigations, Geology, Marine geology, Sedimentology, Continental slope, Oceans, Atlantic Ocean, Oceanography.
Identifiers: *Ibero-Moroccan shelf.

For a study of water motions related to sediment transport, current data and bottom samples were taken in two areas on the Portuguese and Moroccan shelf near the shelf-break and were supplemented by underwater television observations. Some statistical properties of the observed currents were presented, and their representativeness for the water movement very close to the bottom was discussed. It appeared that the slowly varying currents observed were too weak to start sediment transport. To check whether rapidly changing currents would be strong enough, the probability of occurrence of large surface-wave induced components of bottom currents in this area was estimated from wave statistics. It turn out that such oscillatory currents, especially from swell, would be able to set up sediment motion during certain periods. The net transport was caused by slowly varying currents whose average and maximum magnitudes and directions could be obtained from the short time series of the experiment. The geological data, however, supplied some information about the average directions. A sediment transport towards the upper slope was indicated by the regional grain size distribution at the Portuguese shelf. On the average of bottom currents preferred direction of the mean velocity when the sum of surface-wave-induced currents and slowly varying currents was sufficiently large to set up sediment motion. Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 460, $5.00 in paper copy, $2.25 in microfiche. Scientific Report, July 1974. 94 p, 29 fig, 3 tab, 2 ref. NSF GX-31264.

Descriptors: *Upwelling, *Coasts, *Oregon, *Salinity, *Temperture, Continental shelf, Surveys, Ships, Pacific Ocean, On-site investigations, Instrumentation, *Data collections, Data processing, Oceanography.
Identifiers: *Temperature-salinity functions, Fronts(Oceanic).

The report presents all the continuous surface temperature-salinity data recorded aboard Oregon State University vessels during the summers of 1972 and 1973. Most of these cruises constituted part of the Coastal Upwelling Experiments (CUE-1 and CUE-II), a multi-institutional program to study upwelling off the Oregon Coast. The specific objectives of the individual cruises during CUE-I and CUE-II were quite varied; however, the primary focus being the synoptic study of coastal upwelling off Oregon, cruise tracklines were mainly concentrated over the continental shelf region. Surface maps of the temperature, salinity, and density fields at various times during the summers of 1972 and 1973 and of various extents off the Oregon coast were included in the report. In addition, the transshelf variations of these parameters in the surface along two selected lines, the signatures of surface frontal traverses, and the surface temperature-salinity characteristics were presented. THE EFFECT OF BREAKER SHAPE ON IMPACT PRESSURES IN SURF,
Chicago Univ., Ill. Dept. of the Geophysical Sciences.
R. L. Miller, S. Leverette, J. O'Sullivan, J. Tochko, and K. Theriault.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A002 451, $4.50 in paper copy, $2.25 in microfiche. Technical Report No 14, September 1974. 51 p, 11 fig, 1 tab, 17 ref, 1 append. ONR N00014-67-A-0285-0018.

Descriptors: *Surf, *Waves(Water), *Beaches, Breakwaters, Bores, Pressure, Ocean waves, On-site investigations, Fluid mechanics, Seashores, Coasts.
Identifiers: *Cape Cod(Mass), Impact pressures, Breaking waves, Breaker mechanics.

Field measurements were made of the vertical distribution of impact pressures exerted by breaking waves, Four distinct types were recognized and compared. These were near-breaking wave, plunging breaker, spilling breaker and post-breaking bore. The measurements were obtained by placing a 6-foot aluminum flat plate, backed by a cylinder in the surf zone, so that the flat faced the approaching breakers. Five sensors were placed at one foot intervals in the flat. The sensors consisted of strain gage mounted aluminum disphragms. Results indicated the impact pressure is significantly influenced by breaker type. The bore generated the largest impact pressures, followed in decreasing order by plunging breaker, spilling breaker and near-breaking wave. In the vertical array, the largest impact pressures were recorded at or near the top, except for the bore where the reverse occurred. A qualitative explanation was given of various phenomena associated with impact pressures, by considering breaker mechanics. (Sims-ISWS)

REVERSE OSMOSIS PROCESS USING CROSSLINKED AROMATIC POLYAMIDE MEMBRANES,
Department of the Interior, Washington, D.C. Office of the Secretary.
R. McKinney, Jr., and W. L. Hofferbert.
U.S. Patent No 3,904,519, 6 p, 7 ref; Official Gazette of the United States Patent Office, Vol 938, No 2, p 766, September 9, 1975.

Descriptors: *Patents, *Water purification, *Desalination, *Reverse osmosis, *Separation techniques, *Water quality control, *Membrane processes, *Water pollution control, Saline water, Membranes, Chemical reactions.
Identifiers: Aromatic polyamide membranes.

A reverse osmosis process is used for the purification of saline water. A pressure in excess of the osmotic pressure of the saline water feed solution is applied to the solution separated from purified water by a semipermeable membrane. Pure water is thereby caused to diffuse through the membrane while the salt molecules or other impurities are retained by the membrane. Reverse osmosis membranes of improved flux or flux stability are prepared by crosslinking aromatic polyamide membranes. Crosslinking may be achieved by reaction with crosslinking reagents such as aldehydes, polyamines, polycarboxylic acids, polyisocyanates, oxidizing agents, peroxides, etc. It may also be accomplished by means of irradiation, e.g., with gama radiation. Sulfuric acid, which may become abundant through industrial by-product recovery, can be used as an aid to increase water penetration of sodium-affected calcareous range land and irrigated soils. Water penetration into calcareous soils was measured in soil columns after sulfuric acid was applied to the soil surfaces. Water penetration reached a maximum with increasing rates of acid application before decreasing at the highest rates. Surface-applied sulfuric acid was more effective than equivalent amounts of applied gypsum. (McLachlan-Arizona)

PRIVATELY-OWNED WATER SUPPLY SYSTEMS,
Lehigh-Northampton Counties Joint Planning Commission, Lehigh Valley, Pa.
A. R. O'Dell, and A. B. McCracken.
Final report, September, 1974. 45 p, 3 fig, 1 tab, 2 append. PA-03-26-1030-01.

Descriptors: Water supply, *Dependable supply, Hydrology, *Storage requirements, *Water distribution(Applied), *Water conveyance, Water policy, *Water supply development, Water allocation(Policy), Planning, Legislation, *Pennsylvania.
Identifiers: Lehigh County(Pa), Northampton County(Pa).

An inventory of almost 50 privately owned water supply systems (PWS) in Lehigh and Northampton Counties was undertaken to assess the current situation and present recommendations and policies to resolve the potential problems which result from proliferation of PWS. Using data obtained from Pa. Department of Environmental Resources (DER) and Public Utilities Commission (PUC), the following information was recorded: name of supplier; PUC regulation; number of customers; percent of total water use by type of customer; average water use per dwelling unit; projected number of fire hydrants; treated water storage tanks; and water supply sources. Potential problems, including conflicts with regional water supply plan, level of service and inadequacy of existing regulations and enforcement emphasize the need to develop water supply guidelines. Conclusions are that (1) private water systems should be identified and regulated during the subdivision review process, and then required to connect with the public water supply system when a feasible extension and adequate supply is available; (2) standards and regulations specifying water supply quantity and facilities for a PWS should be established by DER and PUC; (3) PWS should be allowed in areas where regional water system is not foreseen as they may provide reliable service at lower costs than individual water systems. Appendices include a compilation of applicable regulations and guidelines for water supply systems as well as an environmental assessment of the proposed recommendations. (Salzman-North Carolina)

ELONGATION CHARACTERISTICS OF CORRUGATED PLASTIC TUBING,
Ohio State Univ., Columbus
G. O. Schwab, and R. D. Brehm
Presented at 1974 Winter Meeting of the American Society of Agricultural Engineers, December 10-13, 1974 Chicago, Illinois Paper No 74-2540 American Society of Agricultural Engineers, St Joseph, Michigan. 5 fig, 6 ref.

Descriptors: *Plastic pipes, Plastic deformation, Temperature, Pipelines, Construction, Tubes
Identifiers: Corrugated tubing, Elongation, Stretching.

Elongation (stretch) of circular corrugated plastic tubing decreased parallel plate stiffness at 5% deflection about 1.6%, 2.3%, and 0.4% for each one percent elongation of 76 mm (3-in, 102 mm (4 in.), and 152 mm (6-in) diameter tubing, respectively. Four brands of tubing were included in the tests. Stiffness of 203 mm (8-in) diameter tubing consistently (4 brands) increased up to 5% elongation with only a small decrease at 10%. In other tests the elongation of three brands of 102 mm tubing varied from about 2 to 6% at 23 C (standard test temperature) and from 9 to 18% at 70 C. For all three brands tested, elongation varied linearly with temperature. Spiral corrugations showed less elongation than circular corrugated tubing. Elongation of corrugated tubing in the field as installed with several trenching machines varied from zero to 4.5% with an average of 2.1%. Although tubing temperature was high (35 to 52 C), temperature did not appear to be a major cause of stretching. Frictional drag and other effects as the tubing passed through the machine caused most of the stretching. The study showed that elongation is not a serious (up to 5%) problem unless the contractor is careless or intentionally stretches the tubing. (Skogerboe-Colorado State)

STEADY INFILTRATION FROM LINE SOURCES BURIED IN SOIL,
Department of Agriculture, Watkinsville.
A. W. Thomas, E. G. Kruse, and H. R. Duke.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 17, No 1, p 125-128, 133, January-February 1974. 7 fig, 6 ref.

Descriptors: *Soil water movement, *Subsurface irrigation, *Infiltration, *Mathematical studies, Mathematical modeling, Irrigation systems, Irrigation, Agriculture, Model studies, Capillary conductivity.
Identifiers: *Trickle irrigation, *Drip irrigation.

Results are presented of a study of steady infiltration from a distribution of buried line sources which lie in a horizontal plane and are parallel and equally spaced. The sources simulate subsurface irrigation laterals. An analytical solution is made possible by the use of a quasilinear form of the differential flux equation and an exponential relationship between hydraulic conductivity and capillary potential of the soil modeled. The objective of the paper is to develop the analytical solution and compare the computed distributions of capillary potential for normal field lateral spacings and depths with those computed by more complex methods. WATERHAMMER CONSIDERATIONS FOR PVC PIPELINE IN IRRIGATION SYSTEMS,
Certain-Teed-Products Corp., Valley Forge, Pa.
W. R. Seipt.
Transactions of the ASAE (American Society of Agricultural Engineers) Vol 17, No 3, p 417-423, May-June 1974. 6 fig, 5 tab, 26 ref.

Descriptors: *Water hammer, Hydraulic conduits, Hydraulic design, Hydraulic equipment, Hydraulic structures, Irrigation design, Flow characteristics, Agriculture, Irrigation, *Irrigation systems.
Identifiers: *Polyvinyl chloride pipe.

Waterhammer pressure develops whenever flow is changed. Flow changes occur by operating valves, by starting or stopping pumps, or by sudden release of entrapped air. Its intensity depends upon the rate of change. On occasion, it damages piping. Waterhammer can be contained by: adequate design; proper installation and responsible use. (Skogerboe-Colorado State)
W76-01066

UPWARD WATER MOVEMENT IN FIELD CORES,
Kentucky Univ., Lexington. Dept. of Agricultural Engineering.
L. G. Wells, and R. W. Skaggs.
Presented at 1974 Winter Meeting of the American Society of Agricultural Engineers, December 10-13, 1974. Chicago, Illinois. American Society of Agricultural Engineers. St. Jospeh, Michigan. 15 fig, 2 tab, 25 ref, Paper No 74-2572.

Descriptors: *Subsurface irrigation, *Soil water movement, Irrigation, Irrigation design, Irrigation systems, Hydraulic conductivity, Model studies, Soil properties.
Identifiers: Subirrigation, Richards equation, Pressure potential.

Subirrigation experiments were conducted under various initial and boundary conditions using large, undisturbed soil cores representing two field soils. Water flow volumes and pressure potential distributions were monitored continuously during each test. The desorption soil water characteristic was determined for both soils using pressure plates. The effective saturated hydraulic conductivity was determined for each core used in the experiments. The relationships between hydraulic conductivity and pressure potential, K(k), were determined for each soil type transient pressure potential measurements during a drainage event. An approximate model was developed to describe vertical water movement during subirrigation. The model assumed that the water rises uniformly in the profile, making no provision for water movement in advance of the water table. The model is capable of considering profile stratification. Also the one dimensional h-based form of the Richards equation was solved numerically for conditions corresponding to those imposed during the experiments. (Skogerboe-Colorado State)
W76-01068

HIGH RATE SPRINKLING OF A LOW INTAKE SOIL,
Agricultural Research Service, Brawley, Calif.
L. S. Willardson, B. L. Ertsgaard, C. F. Ehlig, and A. J. MacKenzie.
Transactions of the ASAE (American Society of Agricultural Engineers) Vol 17, No 2, p 280-281, March-April 1974. 2 fig, 1 tab.

Descriptors: *Sprinkler irrigation, Irrigation practices, Irrigation operation and management, Irrigation effects, Frequency, Puddling, Soil management, Soil properties, Irrigation, Agriculture.
Identifiers: Soil crusting.

Water can be applied to low intake rate soils by sprinklin at high average application rates if water is applied intermittently and the average application rate does not exceed the average instantaneous intake rate during the interval of operation. Soil crusts formed on the soil surface when the soil dried, but these crusts did not interfere with plant growth. Greater total amounts of water can be applied without causing ponding and loss of soil surface structure by the use of short sprinkling intervals and by applying smaller amounts of water per day. For equal amounts of applied water, short duration--high frequency applications caused less loss of soil surface structure than long duration--low frequency applications. (Skogerboe-Colorado State)
W76-01069

DRIP IRRIGATION DESIGN BASED ON UNIFORMITY,
Hawaii Univ., Honolulu. Dept. of Agricultural Engineering.
I. Wu, and H. M. Gitlin.
Transactions of the ASAE (American Society of Agricultural Engineers) Vol 17, No 3, p 429-432, May-June 1974. 4 fig, 5 ref.

Descriptors: *Uniformity coefficient, *Irrigation design, Irrigation systems, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

Presented is a general shape of energy gradient line which can be applied to distribution and variation of emitter discharge along the lateral. A design chart is presented for determining an acceptable combination of lateral lengths and inlet pressure of a drip irrigation system. The chart helps in selecting a drip irrigation line based on a desirable or acceptable uniformity coefficient. The designer can try different combinations of pressure and length in order to obtain a design which is acceptable. (Skogerboe-Colorado State)

INSTALLATION CHECKS ON 4-INCH (102 MM) CORRUGATED POLYETHYLENE DRAIN TUBING,
Soil Conservation Service, Upper Darby, Pa.
D. E. McCandless, Jr.
Presented at 1974 Winter Meeting of the American Society of Agricultural Engineers, December 10-13, 1974. Chicago, Illinois, Paper No 74-2543, American Society of Agricultural Engineers. St. Joseph, Michigan. 8 tab, 3 ref.

Descriptors: *Plastic pipes, Pipelines, Construction, Drainage, Drainage engineering, Drainage practices, Tubes, Sands, Clays, Gravels.
Identifiers: Corrugated tubing, Polyethylene.

Results of 54 installation checks on a 4-inch (102 mm) corrugated polyethylene drain tubing in 4 Northeastern states are reported. Checks were made by Soil Conservation Service personnel with the assistance of farmers, contractors, and manufacturers' representatives. Tubing installed in gravelsoil sites generally had deflections 2 to 5 percent higher than those in clay or sandy soils. Tubing installed in sandy soils had the least deflection and commonly ranged from 13 to 20 percent. Tubing installed in trenches 4 to 5 feet (1.2 to 5 m) deep in sandy soils was doing as well or better than tubing installed at lesser depths. Subsurface drains in the Northeast are commonly installed in trenches 1-1/2 to 4 feet (0.8 to 1.2 m) deep. With 14 percent of the sites being classified as unsatisfactory, it is obvious that in many areas of the Northeast there is a need for a training and installation program on good installation procedures for SCS personnel, contractors, and farmers. (Skogerboe-Colorado State)
W76-01071

ANHYDROUS AMMONIA APPLICATION IN IRRIGATION WATER VS. MECHANICAL AND ITS EFFECT ON CORN YIELDS,
Nebraska Univ., Dept. of Agricultural Engineering.
H. R. Mulliner, and K. D. Frank.
Presented at 1974 Winter Meeting of the American Society of Agricultural Engineers, December 10-13, 1974. Chicago, Illinois. Paper No 74-2567, American Society of Agricultural Engineers. St. Joseph, Michigan. 4 tab.

Descriptors: *Nitrogen, *Nitrogen compounds, *Corn, Fertilization, Fertilizers, Irrigation practices, Irrigation water, Irrigation, Irrigation effects, Plant growth, Ammonia.
Identifiers: *Anhydrous ammonia.

Application of anhydrous ammonia in surface irrigation distribution systems requires top level management. From an energy standpoint, it is more effective because optimum yields can usually be obtained with less nitrogen, and the energy for mechanical application is saved. In the manufacturing process, energy is required to convert anhydrous ammonia to ammonium nitrate and urea; thus, the ability to utilize anhydrous ammonia directly in surface irrigation systems is an additional savings of energy. Salts in the irrigation water presented no problem of encrusting inside the distribution system (aluminum gated pipe) when the inhibitor sodium polyphosphate was used. Irrigation water will carry from 50 to 110 ppm anhydrous ammonia before it is lost into the atmosphere. Keeping within these limitations is necessary for efficient application. Optimum grain yields were obtained with the application of 120 pounds of nitrogen. In 1972, grain yields were essentially the same whether anhydrous ammonia was applied in the irrigation water or applied mechanically. In 1973, water applied anhydrous ammonia gave significantly better yields than mechanically applied ammonia. (Skogerboe-Colorado State)
W76-01072

ALTERNATE-FURROW IRRIGATION OF FINE TEXTURED SOILS,
Southwestern Great Plains Research Center, Bushland, Tex.
J. T. Musick, and D. A. Dusek.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 17, No 2, p 289-294, March-April 1974. 10 fig, 1 tab, 8 ref.

Descriptors: *Furrow irrigation, *Furrow systems, Irrigation effects, Irrigation efficiency, Irrigation practices, Furrows, Crop response, Sugarbeets, Grain sorghum, Potatoes, Soil salinity, Infiltration rates, Irrigation, Agriculture, Silts, Clays, Loam.
Identifiers: Alternate furrow irrigation, Pullman soils.

Alternate-furrow irrigation of bed-furrow spacings ranging from 30 to 40 inches were evaluated for irrigating slowly permeable Pullman soils. Alternate-furrow irrigation had little effect on water intake and yields on Pullman silty clay loam but significantly reduced both intake and yields of sugarbeets and grain sorghum on Pullman clay loam. The reduction in water intake and yields was concentrated on the lower one-fourth to one-half of the field plots depending primarily on the irrigated furrow spacing and length of run. Lateral wetting extended from the irrigated furrow into the adjacent nonirrigated furrow past midfield under all conditions evaluated. Alternate-furrow irrigation of bed-furrow spacings exceeding 30 inches is not recommended on slowly permeable clay loam soils. Although alternate furrow irrigation significantly reduced size of irrigation, the concentration of this effect on the lower part of a field and associated yield reductions limits the usefulness of the practice for more efficient management and use of water. (Skogerboe-Colorado State)

THE EFFECT OF SOIL WATER SUPPLY ON CORN FERTILIZER RESPONSE,
Agricultural Research Service, Morris, Minnesota.
T. C. Olson, and C. A. Onstad.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 17, No 5, p 914-916, September-October 1974. 5 tab, 10 ref.

Descriptors: *Crop response, *Corn, *Soil water, *Fertilization, Rainfall, Crop production,

LIBRARY U. OF I. URBANA-CHAMPAIGN

Statistics, Agriculture, Agronomic crops, Moisture stress, Moisture availability, Moisture content, *Soil-water-plant relationships.

The study reported was designed to determine the possibility of estimating the optimum amount of fertilizer needed for greatest efficiency when the amount of water stored in the soil profile at planting time is known. Conversely, would increasing stored water increase the efficiency of fertilizer. Response to applied fertilizer under different levels of stored water at planting and different patterns of rainfall were studied to identify the types of interactions between water stress and fertility response by corn. Corn grain yields for six treatments are reported for each year. Significant differences as indicated by LSD are shown on an individual year basis. Annual average yields of main treatments illustrate the influence of stored water. The combined analysis of varience indicated highly significant differences in yield among years but no significant difference in overall average yields among main treatments or between fertility levels. The year x main treatment, and the year x fertility-level interactions were both highly significant (p= 0.01) and the main-treatment x fertility level x year interaction was significant at the 0.05 level. (Skogerboe-Colorado State)

Transactions of the (ASAE) American Society of Agricultural Engineers, Vol 17, No 2, p 282-285, March-April 1974. 6 fig, 18 ref.

Descriptors: *Design criteria, *Irrigation design, *Subsurface irrigation, *Head loss, Irrigation methods, Flow rates, Irrigation, Agriculture, Orchards, Discharge frequency.
Identifiers: *Trickle irrigation, *Furrow irrigation, *Uniformity, Drip irrigation, Chamber method.

By varying cross sectional area and length of the low pressure distribution line (chamber), uniform discharge rates can be produced through emitters. Discharge rates can be changed by adjusting chamber pressure. 'Quick-fill' is necessary to make the system practical. In other words, the chamber must be charged with water before good operation begins. Field installation in an apple orchard is discussed. (Skogerboe-Colorado State)

IRRIGATION TIMING BY THE STRESS DAY INDEX METHOD,
Texas A and M Univ., College Station. Dept. of Agricultural Engineering.
E. A. Hiler, T. A. Howell, R. B. Lewis, and R. P. Boos.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 17, No 3, p 393-398, May-June 1974. 2 fig, 8 tab, 28 ref.

Descriptors: *Stress, *Stress analysis, Irrigation practices, Crop production, Optimization, Water conservation, Water requirements, Irrigation, Agriculture, Plant growth.
Identifiers: *Stress day index, *Irrigation scheduling, SDI.

A potentially useful concept for optimizing irrigation timing is the stress day index (SDI). The SDI and its components are defined and examples are used to show how this approach can be utilized for timing irrigations. Experimental findings related to use of SDI are presented. The SDI concept is formulated as the product of a crop susceptibility factor (CS) and a stress day factor (SD). Values of CS depend on species and stage of development and indicate the plant's susceptibility to a given water deficit at different growth stages. A method for determining CS is given along with quantitative values for various irrigated crops. Irrigation timing is accomplished with the SDI approach when the daily SDI (daily SD x CS for the appropriate growth stage) reaches some predetermined critical value. Basically, the water deficit indicator (SD) is weighted according to crop sensitivities at different growth stages so that reduced water deficit occurs during critical periods. (Skogerboe-Colorado State)

OPTIMIZATION OF WATER USE EFFICIENCY UNDER HIGH FREQUENCY IRRIGATION: II SYSTEM SIMULATION AND DYNAMIC PROGRAMMING,
Texas A and M Univ., College Station. Dept. of Agricultural Engineering.
T. A. Howell, E. A. Hilder, and D. L. Reddell.
Presented at 1974 Winter Meeting of the American Society of Agricultural Engineers, December 10-13, 1974. Chicago, Illinois. Paper No 74-2565, American Society of Agricultural Engineers, St. Joseph, Michigan, 28 p, 3 fig, 5 tab, 17 ref.

Descriptors: *Optimization, Dynamic programming, Simulated rainfall, Simulation analysis, Monte Carlo method, *Water utilization, Irrigation practices.
Identifiers: *High frequency irrigation, System simulation.

An environmental simulation model (temperature, rainfall, and potential evaporation) was developed for Temple, Texas. Using Monte Carlo techniques, daily environmental data could be simulated for input to the soil water balance model. The simulation results adequately represented the stochastic serial-correlation of these variables. Stochastic dynamic programming was used to maximize yield, subject to water availability constraints. These results showed the proper irrigation decision for each period of the soil water content and amount of irrigation water at the start of the period were known. Finally, these results demonstrated that the irrigation amount could be substantially reduced without a large decrease in expected yield if the irrigation water was distributed optimally over the season. This study demonstrated the tremendous possibilities of applying the techniques of system simulation, dynamic programming and decision analysis to the irrigation problem. (Skogerboe-Colorado State)

N. Dudley.
In: Hydrology Symposium, Armidale Australia, 1975. The Institution of Engineers Australia, Preprints of Papers, p 144-147, May 1975. 1 fig, 9 ref.

Descriptors: *Irrigation programs, *Water supply, *Reliability, *Project planning, *Economic efficiency, Irrigation design, Water requirements, Variability, Dependable supply, Storage capacity, Costs, Average income, Computer models.

A brief summary is presented of two computer-model studies and one historical analysis of reservoir-irrigation systems operating under climatic uncertainty. The results indicate that the traditional goal of designing and operating such systems so as to largely eliminate water shortages to farmers can be costly in terms of average annual net revenue foregone. That is, the tradeoffs between system designs which minimise the variance of annual net revenue from the project and those which maximise annual net revenue may be very significant. The complexity of the design considerations is emphasised. (CSIRO)

ASSESSMENT OF MODELS SUITED FOR THE HYDROLOGICAL ANALYSIS OF URBAN STORM DRAINAGE (A VAROSI CSAPADEK CSATORNAZASI HIDROLOGIAI SZAMITASRA ALKALMAZOTT MODELLEK ERTEKELESE).
I. Wisnovszky.
Hidrologiai Kozlony, Vol. 52, No. 10, p 443-445, October, 1972. 7 ref.

Descriptors: *Model studies, *Storm runoff, *Urban runoff, Cities, Drainage systems, Computers.
Identifiers: Narayana-Riley model, Tholin-Keifer model.

Models for the analysis of urban storm water runoff are evaluated. In its present state, the Rational Formula is not adaptable to urban runoff conditions and must be modified for this specific use. The Tholin-Keifer model, developed originally for Chicago redevelopment programs, can be adapted to other urban conditions since the dimensioning of the drainage system is based on the most probable form of precipitation distribution with respect to time. Finally, the computerized Narayana-Riley model, operating with regression analysis for the determination of relationships between area characteristics and specific runoff load, constitutes a generally applicable design procedure. TOWARDS RATIONAL DRAINAGE DESIGN,
A. J. Wilson, and A. L. Britch.
Building Science, Vol 8, No 1, p 23-26, March, 1973. 4 fig, 6 ref.

Descriptors: *Model studies, *Sewerage, *Drainage systems, Flow rates, Costs, Pipes, Excavation, Algorithms.
Identifiers: Flow estimation.

A simple, rational, and effective algorithm developed for use in estimating flows expected in any sewer drainage system is shown over extensive tests to behave well and give reliable and apparently accurate results which compare very favorably with those obtained by other methods. Comparative results indicate that previous techniques of flow estimation are unnecessarily conservative, and further it is to be expected that use of this approach would result in significant economic benefits since decreased design flow means smaller diameter pipes and decreased gradients necessitating less excavation. At the present time, large scale tests are being planned with the dual purpose of testing the accuracy of the flow predicted by the program and to obtain more accurate empirical data on the discharge characteristics of the different types of equipment upon which the program depends. EFFECTS OF INUNDATION PERIOD ON SEEDLING GROWTH,
Texas A and M Univ., College Station. Dept. of Agricultural Engineering.
T. A. Howell, and E. A. Hiler.
Transactions of the ASAE (American Society of Agricultural Engineers) Vol 17, No 2, p 286-288 and 294, March-April 1974. 5 fig, 1 tab, 11 ref.

Descriptors: *Drainage effects, *Drainage practices, Drainage, Crop response, Corn, Cotton, Grain sorghum, Lysimeters, Aeration, *Flooding, *Plant growth, Flood damage, Submergence, Wetting.
Identifiers: Peas, Seedling growth, Inundation.

In considering the necessary steps for proper agricultural drainage design, the logical first step is the determination of the crop's drainage requirement. Rindings concerning effects of inundation period on soil oxygen diffusion rates and crop response during the seedling growth of four selected plant species are presented. Corn, cotton, grain sorghum, and southern pea plants were grown for 30 days in field lysimeters which were inundated for periods of 2, 5, and 8 days, starting approximately 1 week after emergence. Undisturbed soil cores which were 90 cm in diameter and 180 cm deep made up the lysimeters. Rainfall was kept off the lysimeters with an automated shelter system. Oxygen diffusion rate and soil water pressure potential measurements were made in the crop root zone on a regular basis. Primary crop response measurements included crop height during the growing season and dry matter yield at the end of the growth period. Water was added at the soil surface to maintain the soil water pressure potential in the crop root zone between -10 and -20 centibars, and hence prevent crop water stress, during periods when no flooding occurred. Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 101, No IR2, p 95-109, June, 1975. 15 fig, 3 ref, append.

Descriptors: *Hydraulic valves, *Distribution systems, *Irrigation engineering, *Surface irrigation, *Flow control, Automation, Irrigation systems, Pipes, Water distribution(Applied), Irrigation practices, Irrigation design, Irrigation operation and maintenance, Conveyance structures, Irrigation, Water delivery, Operating costs, Water control, Irrigation efficiency, Design criteria.

Automatic irrigation valves have been developed to control the discharge from a field pipeline turnout into either gated pipe or directly into irrigation borders, Design information for 6-inch, 8-inch and 10-inch valves is given. Two types of water-inflatable bladders are used to open and close the valves which are designed to operate with water from the irrigation pipeline at pressures up to approximately 12 pounds per sq inch. Small 3-inch pilot valves, operated by a 3 volt dc battery powered motor, are used to control opening and closing of the irrigation valves. This motor/pilot-valve unit can be used with mechanical and electronic timers, commercial irrigation controllers, or radio transmitter/receiver units. (Robinett-Arizona)

INTERACTION OF CALCIUM AND 2,4-D ON EURASIAN WATERMILFOIL,
Tennessee Valley Authority, Muscle Shoals, Ala. Environmental Biology Branch.
R. A. Stanley.
Weed Science, Vol 23, No 3, p 182-184, 1975. 3 fig, 1 tab, 34 ref.

Descriptors: *Calcium, *Herbicides, *2,4-D, Root systems, Growth rates, Inhibition, Hardness(Water), Tennessee, Rates of application, Aquatic weed control.
Identifiers: Eurasian watermilfoil.

The effect of calcium on treatment of Eurasian watermilfoil (Myriophyllum spicatum) with 2,4-D was determined. Shoot and root growth and length were inhibited less by 2,4-D in soil lacking calcium. With 30-day exposures to 2,4-D, calcium had to be added to distilled water in concentrations corresponding to those in hard water to produce maximum herbicidal responses. At lower calcium levels, equivalent to soft water, herbicidal response was about the same as in distilled water. When watermilfoil was exposed to 2,4-D for two days, then grown in hard water so uptake and growth were temporarily separated, root inhibition was proportional to calcium chloride concentra-

LIBRARY U. OF I. URBANA-CHAMPAIGN

tion during 2,4-D uptake. As little as 0.1 mM calcium chloride facilitated growth inhibition by 2,4-D. Differences in field treatment effectiveness were calculated to be 48% greater at the highest natural calcium concentrations than at the lowest calcium concentrations in water of the Tennessee Valley. Effective field treatment rates with 2,4-D could be varied over a two-fold range depending on calcium concentration at time of treatment. Water samples should be analyzed for calcium before treatment and rate of application adjusted accordingly. (Buchanan-Davidson--Wisconsin)

Identifiers: *Agricultural water, Profit maximization, Mathematical programming.

This paper examines the efficient allocation of water in Utah in time frames up to 2020 under various alternative assumptions and calculates the cost of alternative policies. Using mathematical programming, a computer model is developed to determine the supply (marginal cost) and demand (value of marginal product) relationships for agricultural water, given depletions for municipal and industrial (MandI) and wetland requirements. The model maximizes net profit per acre to an average agriculturalist in each of ten study areas in Utah. Proposed interbasin transfers and their costs are included in supply. The optimal solution generated is an efficient allocation, since maximization of net profits occurs only when value of marginal product equals marginal cost. The requirements for MandI water are projected into the future using trending and probable industrial development. Using alternative assumptions about policies (minimum inflows to Great Salt Lake and water salvage), several alternative temporal distributions are determined. The critical factor in large proposed water transfers in Utah appears to be the growth of MandI requirements along the Wasatch Front, particularly in the Jordan River Basin. Sufficient water is available in the Colorado River Basin to provide maximum transfers, full oil shale and power generation development, and efficient agricultural production. Restrictions on groundwater pumping and water salvage in the Jordan River Basin and maintenance of high inflows to Great Salt Lake make earlier transfer necessary. (Bell-Cornell)

LAND-CAPABILITY CLASSIFICATION THE LAKE TAHOE BASIN, CALIFORNI NEVADA, A GUIDE FOR PLANNING,
Forest Service (USDA), Ogden, Utah. Intermoutain Forest and Range Experiment Station.
R. G. Bailey
Prepared in cooperation with the Tahoe Regio Planning Agency. 1974 33 p, 13 fig, 1 map, 66 r append.

Descriptors: *Land classification, *Land u *Land development, *Land management, *S types, Erosion, Drainage, Hydrologic properti Geomorphology, Planning.
Identifiers: *Lake Tahoe(Calif), *La Tahoe(Nev).

Since the late 1950's the Lake Tahoe Basin, cov ing 500 square miles, has been subjected to ra development which has been responsible for ma improper land development procedures, includi failure to recognize hydrologic and topograp limitations, unnecessary destruction of vege cover, realignment and pollution of streams, e croachment on flood plains, and disruption drainage. This study classified the land accordi to 'land tolerance' as a measure of capabil which is defined as a level of use an area c tolerate without sustaining permanent dama through erosion and other causes. The capabil classes are estimated by the degree to whi potential hazards arising from improper use a absent. Principal factors used in distinguishing t seven land capability ranks shown on the final m were: Soil Type (along with erosion hazar hydrologic-soil group, soil drainage and rockine and stoniness); and Geomorphic Setting includi 6 groups: glaciated granitic uplands, glaciated v canic flowlands, streamcut granitic mounta slopes, streamcut volcanic flowlands, deposition lands, and oversteeped slopes. The 7 classes f into 3 general categories each with implications f land use: High hazard lands, lands that shou remain in their natural condition; moderate haza lands, lands that are permissive to certain uses b not others; and low hazard lands, lands that a most tolerant to urban-type uses. In addition ea of the classes is given a single numerical index i dicating the percentage, ranging from 1 to 30 pe cent, of the land which can be used for impervio cover if environmental balance is to be mai tained. NEW STRATEGIES FOR WATER RESOURCE PLANNING AND MANAGEMENT,
Johns Hopkins Univ., Baltimore, Md.
S. H. Hanke, and R. K. Davis.
In: Priorities in Water Management, Western Geographical Series, Vol 8, F. M. Leversedge, ed. University of Victoria, Victoria, British Columbia, p 117-139, 4 tab, 19 ref. 1974.

Descriptors: *Water control, *Water management(Applied), *Water costs, *District of Columbia, *Water demand, *Pricing, *Potomac River, *Droughts, Water distribution(Applied), Administration, Non-structural alternatives, Water supply development, Cost-benefit analysis, Pumping, Model studies.
Identifiers: *Washington, D.C., Estuary pumping, Drought losses, Minimum storage system, Department of the Interior's 1980 system, Council of Government's Board of Engineers' 2010 system, Seasonal models.

Using the District of Columbia metropolitan area, this paper analyzes problems of water resource planning and management in terms of incremental costs and values and investigates pricing policy as an alternative to technical solutions. Four proposed storage systems in the Potomac River Basin made up of different components and producing drought protection of various kinds and degrees were tested for hydraulic performance. Total annual costs were estimated as follows: minimum storage plus acceptance of some drought losses, $1.7 million; minimum storage plus estuary pumping to meet moderate drought conditions, $.54 million; Department of Interior 1980 plan for average withdrawal plus some peaking capacity of flow to estuary, $2.6 million; Council of Governments 2010 plan for daily withdrawal plus peaking capacity in July and August, average estuary flow, $5.1 million. Under the 1980 and 2010 systems, cost apportionments faced by local governments are so small that local policy-makers can officially advocate a larger system than can be economically justified. Preferred allocation of costs assigns costs in direct proportion to benefits received. Projects having local benefits should be paid for by local governments. When costs are not shared with the federal government both of the unconventional minimum storage alternatives (drought losses and estuary pumping) rank ahead of proposed 1980 and 2010 projects in terms of real resources that must be foregone to produce any projects. Demand management through seasonal pricing is discussed. In Washington, D.C., seasonal (winter and summer) water rates accurately reflect the system costs imposed by various users over the year. By implementing these seasonal rates, the proposed investments in capacity could be deferred at a significant saving. (See also W76-01347) (Hufschmidt-North Carolina)

SPECIAL FLOOD HAZARD REPORT: CAMPBELL CREEK, GREATER ANCHORAGE AREA.
Army Engineer District, Anchorage, Alaska.
Prepared for the Greater Anchorage Area Borough, May, 1975. 18 p, 28 plates, 3 tab.

Descriptors: *Floods, *Flooding, *Flood flow, *Flood forecasting, *Flood profiles, Surface runoff, Peak discharge, Bank erosion, Flood damage, Ice jams, Glaciation, Warning systems, Control structures, *Alaska, Floodways.
Identifiers: Anchorage(Alaska), Greater Anchorage Area Borough(Alaska), Campbell Creek(Alaska), Little Campbell(Alaska), Intermediate Regional Flood.

The area covered in this report has a drainage area of 126 sq mi and includes the main stem of Campbell Creek, the north and south forks of Campbell Creek to the military reservation boundary, and Little Campbell Creek to the foothills of the Chugach Mountains. Continuing commercial and extensive residential development of the area is contributing to the danger of flooding by removing vegetation (which formerly reduced runoff) and necessitating the construction of culverts which tend to clog during flood conditions. The Greater Anchorage Area Borough has a program for installing larger culverts in troublesome areas, a flood warning system, and a zoning ordinance which is under consideration. Flooding can occur during any season. Winter flooding results from the effects of glaciation; spring floods result from snowmelt and ice conditions; summer floods result from heavy rainfall. An Intermediate Regional Flood on Campbell Creek would have a peak discharge of 1320 cubic feet per second with channel velocities of up to 10 ft/sec and overbank flows of less than 3 ft/sec. Damage from an IRF could include broken water lines, bank erosion, and the effects of floating debris. Flood profiles include a hydraulic floodway added to limits of the IRF. (Henley-North Carolina)
W76-01361

FLOOD PLAIN INFORMATION: ALISO CREEK, ORANGE COUNTY, CALIFORNIA.
Army Engineer District, Los Angeles, Calif.
Prepared for Orange County Flood Control District, March, 1973. 35 p, 26 fig, 42 plates, 6 tab.

Descriptors: *Floods, *Flood profiles, *Flood data, *Flood plains, Runoff, Flood flow, Streamflow forecasting, Peak discharge, Flood peak, Flood damage, Stream erosion, Bank erosion, Obstructions to flow, Zoning, Channel improvement, *California.
Identifiers: *Aliso Creek(Calif), Wood Canyon Creek(Calif), Sulphur Creek(Calif), English Canyon Creek(Calif), *Orange County(Calif), Standard Project Flood, Intermediate Regional Flood.

Properties along the streams in the vicinity of Laguna Hills studied are primarily agricultural and have been moderately damaged by floods in January and February 1969. Extensive open spaces in the flood plains are now under pressure for future development. Orange County has adopted a flood plain zoning ordinance regulating areas subject to flooding. Large floods have occurred in the past and studies indicate that even larger floods are possible. The drainage area of Aliso Creek is approximately 36 miles and the slope of the creek is 125 feet/mile upstream from the study area and about 25 feet/mile downstream, nearer to the Pacific Ocean. Streamflow data have been available since 1932. Most flooding has been caused by high-intensity rainfall associated with general winter storms. Annual precipitation over the basin averages 15 inches, with major portion between December and March. Extreme peaks can be reached in a matter of hours, rising from nearly dry streambeds. Most of the 12 public bridges and culverts crossing the stream would be obstructive to the Intermediate Regional Flood and even more obstructive to the Standard Project Flood. The most destructive flood on record, that of February 1969, caused damage estimated at $604,000 to mainly roads and bridges and agricultural land. This flood has a discharge of 2500 cfs. It is estimated that an Intermediate Regional Flood would have a discharge of 3800 cfs and a Standard Project Flood would have a discharge of 7500 cfs, measured at the streamflow gage. (Smith-North Carolina)
W76-01362

SPECIAL FLOOD HAZARD INFORMATION: BEAR AND EVANS CREEKS, REDMOND AND VICINITY, WASHINGTON.
Army Engineer District, Seattle, Wash.
Prepared for the City of Redmond and King County, Wash., Novemeber, 1970. 8 p, 12 plates.

Descriptors: *Flood plains, *Flood damage, *Flood profiles, *Flood data, Land use, Planning, Peak discharge, Obstruction to flow, Flood plain zoning, *Washington, Urbanization.
Identifiers: Bear Creek(Wash), Evans Creek(Wash), Cottage Lake Creek(Wash), Seattle(Wash), Intermediate Regional Flood, Flood plain management.

Bear Creek and its two principal tributaries, Evans and Cottage Lake Creeks, have well-defined channels through the study reach near Redmond, Washington, except in the extreme upper reach of Evans Creek. Moderately rolling semiforested side hills border the irregular valleys. The lower section of the Bear Creek-Evans Creek valley is used primarily for farming. Further upstream principal development is residential. Because of the area's proximity to Seattle, future expansion pressures are certain to prevail throughout the basin. Flood season is from October to March. Melting snow may augment rainstorm flooding. There are 43 bridges in the study area where debris may collect and increase extent of flooding. The largest recorded streamflow at the gaging station at Bear Creek occurred in March, 1950, at 654 cfs; at Evans Creek in January, 1965, at 146 cfs; and at Cottage Lake Creeks in January, 1956, at 132 cfs. Intermediate Regional Flood (IRF) discharges were determined from an analysis of past floods and include an adjustment to reflect anticipated future, 40% development of Bear Creek Basin. At the confluence of Bear and Evans Creeks, IRF peak discharge would be 1450 cfs. Flood occurrences greater than the IRF were not investigated. (Diefendorf-North Carolina)
W76-01363

FLOOD PLAIN INFORMATION: EIGHT MILE CREEK, VICINITY OF PARAGOULD, ARKANSAS.
Army Engineer District, Memphis, Tenn.
Prepared for the City of Paragould, August, 1971. 31 p, 11 fig, 14 plates, 3 tab.

Descriptors: *Flooding, *Flood flow, *Flood water, *Flood forecasting, *Flood profiles, *Flood peak, *Peak discharge, Historic floods, Storms, Flood frequency, Flood damage, Creeks, Flow duration, *Arkansas.
Identifiers: Paragould(Ark), Greene County(Ark), Eight Mile Creek(Ark), Standard Project Flood, Intermediate Regional Flood.

The portion of Eight Mile Creek covered in this report has a reach length of 9.65 miles and drain 168 square miles in the areas of Paragould, located on the eastern slope of Crowley's Ridge in northeast Arkansas. Commercial, industrial, and residential

LIBRARY U. OF I. URBANA-CHAMPAIGN

development in the flood plain is susceptible to flood damage. Duration of flooding can be expected to be relatively short. In this study area the creek has a slope of 7.5 ft/mile. There are no flood control measures or flood warning systems. Flood control improvements on Eight Mile Creek will be considered as a part of the St. Francis River Basin study. Information gained from newspaper files and local residents indicates that large floods on Eight Mile Creek in the Paragould Vicinity have occurred in 1937, 1945, 1957, and 1969. The flood in January, 1969 caused extensive damage ($1 million) to some business concerns and resulted in the evacuation of some 25-30 families. An Intermediate Regional Flood on Eight Mile Creek can be expected to flow at 10,800 cfs at the lower study limit with velocities of 5.8 and 1.7 feet per second in the channel and overbank areas, respectively, and reach a height 0.7 to 1.5 ft higher than the 1969 flood. A Standard Project Flood will flow at 27,700 cfs at lower study limit with velocities of 8.1 and 2.4 ft/second in the channel and overbank areas, respectively, and reach a height from 2.2 to 4.3 ft higher than the 1969 flood. (Henley-North Carolina)
W76-01364

FLOOD PLAIN INFORMATION: PART I - BAYOU BARTHOLOMEW AND TRIBUTARIES, CITY OF PINE BLUFF, ARKANSAS.
Army Engineer District, Vicksburg, Miss.
Prepared for the City of Pine Bluff, Arkansas, November, 1973. 28 p, 15 fig, 25 plates, 8 tab.

Descriptors: *Floods, *Indirect flood measurement, *Flood stages, Flood flow, *Flooding, *Flood forecasting, *Flood profiles, Historic floods, Storms, Flood data, Flood peak, Peak discharge, Flood damage, Warning systems, Control structures, *Arkansas, Canals.
Identifiers: Pine Bluff(Ark), Jefferson County(Ark), Bayou Bartholomew(Ark), Ouachita River(Ark), Standard Project Flood, Intermediate Regional Flood.

Development in the flood plains of Bayou Bartholomew and its tributaries, Nevins Creek, Pine Bluff, Outlet Canal, Interceptor Canal, Harding Drain, and Boggy Bayou, includes residential, agricultural, industrial and commercial uses. Development of these flood plains is expected to be minor because there is adequate land for these uses outside the flood plain. The drainage area covered in this report consists of 86 square miles with stream slopes ranging from 3.5 ft/mi in the hill areas to .5 ft/mi in the alluvial valley. Streamflow data were measured by 4 gages in the Bartholomew Bayou study area. Prolonged periods of rain in winter and spring and thunderstorms in the summer months create flooding. Heavy vegetation and many of the 98 bridges which cross streams in the area are capable of obstructing flood flows. On Bayou Bartholomew, the Intermediate Regional Flood would have a peak discharge of 7,130 cfs, channel velocities of up to 6 ft/sec, with flooding of residential, commercial, and industrial sectors of Pine Bluff. A Standard Project Flood would have a peak discharge of 17,200 cfs. Flood control measures include building the Interceptor Canal, enlarging of the Pine Bluff Outlet Canal in 1954, and maintaining an ongoing program of clearing existing ditches, drains, and culverts. There are no city or county zoning ordinances or building codes specifically intended to reduce flood damage. Flood control problems will receive attention as part of a Water Management Study presently being undertaken by the Corps of Engineers. (Henley-North Carolina)
W76-01365

SPECIAL FLOOD HAZARD INFORMATION: WOLF LODGE CREEK AND TRIBUTARIES, VICINITY OF COUER D'ALENE, IDAHO.
Army Engineer District, Seattle, Wash.
Prepared for Kootenai County, Idaho, December, 1971. 8 p, 1 fig, 8 plates.

Descriptors: *Flood plains, *Planning, *Flood plain zoning, *Floodway, Erosion, Flood damage, Obstruction to flow, Flood profiles, Flood data, Land use, *Idaho, Flood stages, Lake stages.
Identifiers: Wolf Lodge Creek(Idaho), Kootenai County(Idaho), Coeur d'Alene Lake(Idaho), Wolf Lodge Bay, Flood plain management, Intermediate Regional Flood.

This report is intended to provide the basis for further study and planning by Kootenai County to minimize damages caused by flooding of Wolf Lodge Creek. The well-defined creek drains forested foothills and empties into Wolf Lodge Bay, an arm of Coeur d'Alene Lake. In the steeper reaches it carries a heavy load of gravel. Spring is the major flood season. Floods are caused primarily by melting snow, and some are augmented by heavy rains. There are numerous natural and man-made obstructions to flood flow. At the mouth, peak discharge of an Intermediate Regional Flood would be 4250 cfs and channel velocities would range from 1 to 10 feet per second. The higher velocities are sufficient to cause bank erosion. Coeur d'Alene Lake affects stream stages on the lower 1.7 miles of the creek. Maximum flooding conditions occur when the lake stage is high at the time of peak flows on the creeks. The flood plain is used primarily for farming, although there is some residential development, including a trailer park which is subject to inundation. Recommended are utilization of land use zoning measures and establishment of a hydraulic floodway and floodway fringe. (Diefendorf-North Carolina)
W76-01367

FLOOD PLAIN INFORMATION: POCOSHOCK AND POCOSHAM CREEKS, CITY OF RICHMOND AND CHESTERFIELD COUNTY, VIRGINIA.
Army Engineer District, Norfolk, Va.
Prepared for Chesterfield County, Virginia, July, 1971. 41 p, 10 fig, 8 plates, 12 tab.

Descriptors: *Floods, *Flooding, *Flood profiles, *Flood plain, Flood control, Flood protection, Water management(Applied), *Virginia.
Identifiers: Pocoshock Creek(Va), Pocosham Creek(Va), Richmond(Va), Chesterfield County(Va), Intermediate Regional Flood, Standard Project Flood.

Pocoshock Creek flows into Falling Creek about 6.4 miles from the confluence of Falling Creek with the James River. Pocosham Creek, a tributary, flows into Pocoshock Creek at about river mile 0.9 on Pocoshock Creek. Average slopes on Pocoshock and Pocosham Creeks are 19.2 feet per mile and 34.7 feet per mile respectively. Only a small amount of residential development lies on the flood plain. There is no record of houses being flooded. The main flood season is during the summer and fall resulting from intense local thunderstorms or tropical storms. Also, flooding occurs in any season from combination of heavy rainfall lasting several days and the increased runoff resulting from development of the drainage area. Primary obstructions to flow include bridges, highway fills and natural obstructions. No flood control measures exist except for a county-required flood study before approving subdivision and site development plans. No stream flow records exist, therefore flood data were determined by highwater marks and personal interviews. Most recent flood was in August, 1969. An Intermediate Regional Flood (IRF) would be 4 to 6 feet higher than the August 1969 flood while a Standard Project Flood would be 1 to 5 feet higher than an IRF. (Salzman-North Carolina)
W76-01368

FLOOD PLAIN INFORMATION: CASPER, WYOMING, VOLUME III, NORTH PLATTE RIVER.
Army Engineer District, Omaha, Nebr.
Prepared for City of Casper, Wyoming, March, 1973. 27 p, 16 fig, 13 plates, 5 tab.

Descriptors: *Flood plain, *Flood control, *Flo protection, *Flooding, *Flood profiles, *Flo forecasting, *Wyoming, Flood frequency, Histo ic floods.
Identifiers: Casper(Wyo), *North Plat River(Wyo), Intermediate Regional Flood(IRF Standard Project Flood(SPF)

Within the 19.8-mile study reach of the Nor Platte River at Casper, Wyoming, there has be no severe flood recorded, but the potential for highly destructive flood exists. Development h been allowed to locate in the flood plain since t original settlement of the area and present flo plain development includes all types of land use the various municipalities. Past floods have n created substantial damage at Casper due to t large channel capacity, the minimal use of lo grounds adjacent to the stream, and the absence a major flood-producing storm. June, 1931 was t major flood of record in excess of the 7000 c channel capacity, with a peak discharge of 12,7 cfs. Flows at Casper are partially regulated three reservoirs, and additional damage protecti is provided by establishment of flood channel zo ing in Casper. Flood projections include the Inte mediate Regional Flood (IRF) with a pe discharge of 14,400 cfs and the Standard Proje Flood (SPF) with a corresponding peak dischar of 43,000 cfs at a point downstream of Casp Creek. The IRF constitutes a relatively sm damage hazard with minimal present developme in the flood area where all bridges are above t IRF level. The SPF would cause great damage residential, commercial, industrial, and municip developments. (Park-North Carolina)
W76-01369

FLOOD PLAIN INFORMATION: ST. JOE AN ST. MARIES RIVERS, CITY OF ST. MARI AND VICINITY, IDAHO.
Army Engineer District, Seattle, Wash.
Prepared for Benewah County and the City of S Maries, June, 1973. 27 p, 10 fig, 13 plates, 5 tab.

Descriptors: *Flood plains, *Flood plain zonin *Land use, *Flood profiles, Planning, Floo damage, Flood data, Obstruction to flow, Levee Historic floods, *Idaho.
Identifiers: St. Joe River(Idaho), St. Mari River(Idaho), St. Maries(Idaho), Flood pla management, Benewah County(Idaho), Inte mediate Regional Flood.

The wide fertile flood plain of St. Joe River is i tensively farmed with residential, commercial an industrial development, the primary industry beir lumber and wood products. The valley of St. M ries River, a major tributary which has its co fluence with the St. Joe near the city of St. Marie is narrower and devoted primarily to nonintensiv agriculture. Most frequent flooding occurs fro snowmelt during the spring. However, the greate known floods have occurred in the winter an resulted from excessive rainfall and mild temper tures. Floods rise slowly and remain out of banl for a long period. The greatest recorded flood o curred December 1933, reaching 2140.8 ft, mea sea level datum, 1 1/2 feet higher than an Inte mediate Regional Flood (IRF) is expected to be the confluence of the 2 rivers. Obstruction cause by 4 bridges and logs stored on the flood plai could increase flood heights. About 17 miles o levees have been constructed along the lower S Joe, and a 2 1/2 mile long levee and bulk hea system protects the city of St. Maries from flood of the magnitude of the IRF. However, floo flows during an IRF would cover a large portion o the valley including the municipal airport, sewag lagoons, roads, and residences. (Diefendorf-Nort Carolina)
W76-01370

SPECIAL FLOOD HAZARD REPORT: TO REVISE FLOOD PLAIN INFORMATION METROPOLITAN REGION, DENVER

COLORADO; VOLUME II: SAND, TOLL GATE AND LOWER CHERRY CREEKS, SOUTH PLATTE RIVER BASIN.
Army Engineer District, Omaho, Nebr.
Prepared for Denver Regional Council of Governments and Urban Drainage and Flood Controls District, July, 1971. 21 p, 12 photos, 1 tab, 7 plates.

Descriptors: *Flood plains, *Flood damage, *Planning, *Dams, *Flood profiles, *Cloudbursts, Land use, Flood data, Historic floods, Obstruction to flow, Urbanization, *Colorado, Levees.
Identifiers: South Platte River Basin(Colo), Sand Creek(Colo), Toll Gate Creek(Colo), Cherry Creek(Colo), *Denver(Colo), *Flood plain management, Cherry Creek Dam(Colo), Intermediate Regional Flood, Standard Project Flood.

Cherry Creek channel is alluvial, flat-bottomed, and follows a meandering course, sloping downstream from Cherry Creek Dam at 25 ft/mi, with some channel improvements between the dam and Havana Street. Sand Creek has been improved by channel realignment while portions of Toll Gate Creek improved during interstate highway construction. Cherry Creek study reach is highly urbanized and is crossed by 38 bridges which can obstruct flood flow. Sand Creek and Toll Gate Creek are less urbanized, crossed by 17 and 5 bridges respectively. A zone of frequent cloudbursts over highlands at 6,000 to 7,000 feet covers major portions of these basins. Cloudburst storms cause floods from March through August. The Cherry Creek Reservoir impounded a flood which had a peak inflow of 58,000 cfs in June, 1965, the greatest known are flood, saving an estimated $130 million in flood damages downstream. At Toll Gate Creek, flow was estimated to be 17,000 cfs, and at Sand Creek it was 18,900 cfs. Their flooding caused extensive damages, destroying nearly every bridge crossing. At the mouths of Cherry, Sand, and Toll Gate Creeks, discharges of an Intermediate Regional Flood would be 10,900 cfs, 49,500 cfs, and 21,900 cfs respectively, and of a Standard Project Flood, 21,200 cfs, 91,200 cfs, and 31,700 cfs. (Diefendorf-North Carolina)
W76-01371

FLOOD PLAIN INFORMATION: PROCTORS CREEK, CHESTERFIELD COUNTY, VIRGINIA.
Army Engineer District, Norfolk, Va.
Prepared for the Chesterfield County Board of Supervisors, September, 1973. 26 p, 6 fig, 13 plates, 8 tab.

Descriptors: *Floods, *Flooding, *Flood control, *Flood protection, Flood profiles, Flood plains, *Virginia.
Identifiers: *Proctors Creek(Va), Chesterfield County(Va), Standard Project Flood, Intermediate Regional Flood.

Proctors Creek, located in the eastern part of Chesterfield County, south of Richmond, Virginia, flows 7 miles before emptying into the James River. It drains 18.65 square miles and slopes about 21.5 feet per mile. Although channels are clear of vegetation, overbank areas are highly vegetated with trees and brush which would cause obstruction to flood flow. Development in the Proctors Creek flood plain is sparse but it is subject to increasing pressures of growth and development. Although no stream gage record for Proctors Creek exists, data collected from similar streams in the vicinity indicate that floods occur during all seasons, although larger floods resulting from hurricanes occur between May and November. Floods occur from heavy general rainfall and rise to flood peaks in a relatively short time. The duration of flooding varies from less than a day to a couple of days depending on rainfall duration. No flood damage reduction measures exist although flood studies are required before approving subdivision and site development plans. The largest flood occurred on July 18, 1945. The latest flood was July 23, 1969. An Intermediate Regional Flood (IRF) and Standard Project Flood (SPF) would inundate much of the flood plain with estimated peak discharges of 10,920 cfs and 18,730 cfs respectively at the mouth. During the SPF, main channel velocities will average about 5.2 ft/sec with 14.8 ft/sec being about the maximum. Overbank flows will average about 2.1 ft/sec with 5.8 ft/sec as a maximum. Slightly lower velocities may be expected for the IRF. (Salzman-North Carolina)
W76-01372

FLOOD PLAIN INFORMATION: SAN LORENZO RIVER, BOULDER CREEK-FELTON, SANTA CRUZ COUNTY, CALIFORNIA.
Army Engineer District, San Francisco, Calif.
Prepared for Santa Cruz County, July, 1973. 24 p, 12 fig, 18 plates, 6 tab.

Descriptors: *Flooding, *Flood profiles, *Flood data, *Historic floods, *Flood stages, *Flood forecasting, Flood flow, Storms, Flood frequency, Peak discharge, Flood peak, Flow characteristics, Bank erosion, Control structures, Levee, Channel improvement, California.
Identifiers: Santa Cruz County(Calif), Santa Cruz(Calif), *San Lorenzo River(Calif), Boulder Creek(Calif), Bear Creek(Calif), Branciforte Creek(Calif), Standard Project Flood, Intermediate Regional Flood.

The portion of San Lorenzo River Basin covered by this report drains an area of 137 square miles located in central Santa Cruz County. Boulder Creek and Bear Creek join the river near the town of Boulder Creek. The terrain is nearly all mountainous and development is chiefly residential, resorts, and service industries. Bridges, culverts and brush can obstruct flood flows. Flooding has the greatest probability of occuring from November to April. In 1959, the Corps of Engineers completed a flood control project on the lower 2.5 miles of San Lorenzo River and on the lower 1.2 miles of its tributary, Branciforte Creek. Three damaging floods have occurred since 1940 with the worst in December, 1955. Peak discharge on the San Lorenzo reached 30,400 cubic feet per second, 388 acres were flooded, 7 lives lost, 2,830 persons displaced and damages estimated at more than $8,700,900. An Intermediate Regional Flood on the San Lorenzo at Redwoods State Park would reach a peak discharge of 40,000 cfs and would have channel velocities of 8-12 ft/sec. A Standard Project Flood would have a peak discharge of 49,000 cfs at the same location with slightly higher velocities. Overbank flows would average 2-4 ft/sec. (Henley-North Carolina)
W76-01373

FLOOD PLAIN INFORMATION: APTOS, TROUT AND VALENCIA CREEKS, CITY OF APTOS, CALIFORNIA.
Army Engineer District, San Francisco, Calif.
Prepared for Santa Cruz County, California, July, 1973. 17 p, 9 fig, 8 plates, 6 tab.

Descriptors: *Floods, *Flooding, *Streamflow forecasting, *Flood profiles, *Flood damage, *Flood plains, Flood flow, Flood data, Peak discharge, Flood peak, Obstruction to flow, *California.
Identifiers: Aptos Creek(Calif), Valencia Creek(Calif), Aptos(Calif), Trout Creek(Calif), Bridge Creek(Calif), Santa Cruz County(Calif), Standard Project Flood, Intermediate Regional Flood.

The properties on the flood plain along Aptos Creek are urban and agricultural. The small Aptos Creek basin is about 24 square miles in area, extending 7 miles into the Santa Cruz Mountains. Aptos Creek and its prinicipal tributary, Valencia Creek, join together at the Town of Aptos (population 8,704, 1970 census) and drain into Monterey Bay, part of the Pacific Ocean. The streambed slopes from about 8 feet/mile in the lower reaches to about 300 feet/mile in the upper reaches of the study area. The largest recorded flood occurred in 1963. It reached a peak discharge, as recorded by the streamflow gage installed in 1959, of 2110 cubic feet per second and an elevation of 20.82 feet above mean sea level datum. The bulk of flooding on Aptos Creek has occured from December to March. Floodflow stages can rise to flood peaks in a relatively short period of time with high velocity in the main channels. It is estimated that an Intermediate Regional Flood would have a discharge of 3450 cfs and reach an elevation of 24.3 feet and that a Standard Project Flood would have a discharge of 4400 cfs and an elevation of 25.0 feet. Most of the 8 bridges and culverts in the area would be obstructive to the Intermediate Regional Flood. No flood control works have been constructed on Aptos Creek and there are no zoning ordinances or building codes in effect to prevent flood damage. (Smith-North Carolina)

REGULATION OF GREAT LAKES WATER LEVELS, A SUMMARY REPORT, 1974.
International Joint Commission-United States and Canada. Great Lakes Levels Board.
37 p, 40 photo, 6 tab, 7 charts, 1 map.

Descriptors: *Great Lakes, *Surface waters, *Water levels, *Water level fluctuations, High water marks, Low water marks, Elevation, Fluctuation, Lakes, Low flow, Hydraulic gradient, United States, Canada, Governments, Regulation, Water law, Water resources development.
Identifiers: International agreements, Water level studies, Water level control.

The Great Lakes are an international resource and an international responsibility. In 1964, because of the prevailing extreme low lake levels and the highs of 1952, the governments of Canada and the United States initiated a joint study of the water levels in the lakes. An International Joint Commission was established pursuant to Article IX of the Boundary Waters Treaty of 1909. Its purpose was to determine whether action would be practicable and in the public interest. Its function was to improve domestic water supplies, sanitation, navigation, water for power and industry, flood control, agriculture, fish and wildlife, and recreation. The International Great Lakes Levels Board was given the task of investigating factors which affect water levels in the Great Lakes. The Board was then to develop ways of controlling water levels, to estimate the costs of activating projects, and to assess the probable effects of the resulting hydrological, economical, environmental, and aesthetic changes. PREDICTION OF THE EFFECTS OF THE FLOODWATER OF THE OLONA RIVER IN TICINO (PREVISIONI SUGLI EFFETTI DELLA IMMISSIONS DELLE ACQUE DI PIENE DELL' OLONA IN TICINO),
R. Marchetti, A. Provini, and G. Zambon.
Inquinamento, Vol 17, No 6, p 19-33, June, 1975. 14 fig, 13 tab

Descriptors: *Flood control, *Canal construction, Rivers, Water analysis, Flood forecasting, Model studies, Statistical analysis, Overflow.
Identifiers: *Olona River(Italy).

A canal is being built for flood control purposes between the Olona River at the village of Rho and the Ticino at Mt. Abbiategrasso (near Milan, Italy), traversing a distance of 24 kilometers, and will handle overflow loads in the Olona exceeding 10 cu m per second. As a consequence of a potential for pollution of the Ticino from pollution problems in the Olona, a study was made to determine what effect this would have on the Ticino water, utilizing samplings of the Olona made between 1970 and 1972 at Rho. Using analyses of 77 water samples taken at various times of the year, which included determinations of mineral and organic particulate, material capable and incapable of sedimentation, oxygen content, BOD, COD, metals, ammonia, pH, anionic detergents, toxicity, eutrophicating compounds, and phosphorus and nitrogen compounds, statistical studies were made. These predict what effects the Olona flood waters would have on the Ticino when the overflow channel is in operation. It was concluded that a negligible amount of self-purification would take place as the Olona water traverses the 24 km length of the canal. (Morrow-FIRL)

LONG- AND SHORT-TERM FORECASTING OF RIVER DISCHARGE, (IN JAPANESE),
M. Hino, nd K. Ishikawa.
Domiku Gakkai Ronbun Hokokushu, Proceeding of the Japan Society of Civil Engineers, No 236, p 59-70, April, 1975. 15 fig, 4 tab, 9 ref

Descriptors: *Forecasting, *Rivers, Inflow, Data collection, Flow rate, Flood forecasting, Floods, Rain, Precipitation(Atmospheric), Mathematical studies, Hydrological aspects.
Identifiers: River discharge, Factor analysis, Japan, Typhoon.

Analysis of river discharge variation was carried out for the Sagami River, Japan, by canonical factor analysis. Prediction of long-term river discharge was performed by a reconstruction of several factors. Inflow data at Sagami Dam obtained from 1953 to 1970 showed a constant flow rate of approximately 30 cu m/sec from January to April, and great variation for the periods from the end of june to the beginning of July, mid-August to the end of August, and from mid-September to the end of that month. Drought had a periodicity of three years while severe drought had a periodicity of six years. Flood occurred from the end of June to the beginning of July due to concentrated rain; from mid-August to the end of August due to summer typhoon; and from the end of September to the beginning of October due to fall typhoon. The factors considered included basic analysis independent of the effects of rain and typhoon, seasonal variations, and rain and typhoon factors. (Su-FIRL)

BIOLOGICAL CONTROL OF ALLIGATOR WEED,
Office of the Chief of Engineers (Army), Washington, D.C. Aquatic Plant Control Program.
E. O. Gangstad, R. A. Scott, Jr., and R. G. Cason.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-759 500, $6.75 in paper copy, $2.25 in microfiche. Technical Report 3, April 1973. 167 p, 7 ref, 4 append.

Descriptors: *Alligatorweed, *Aquatic weed control, *Aquatic insects, *Biocontrol, *Florida, Weed control, Weeds, Aquatic weeds, Aquatic plants, Aquatic life, Floating plants, Biological treatment, Biological communities, Biology, Insects, Southeast U.S., Rivers, Herbicides.

The Agasicles flea beetle is a major contributor to the role that biotic agents play in regulating alligator weed in its native home, and now in certain areas of the United States. The greatest success with the Agasicles as a biocontrol for alligator weed has been at experimental sites in Florida. The increased effectiveness of the alligator weed beetle in this area is believed to be related to the ability of the insect to overwinter. The Agasicles population usually has two peaks of activity in Florida as compared with one in other states. Alligator weed mats present at the beginning of the study reported herein have decreased in size and thickness. Plant competition has played an important role in controlling the alligator weed at the Goose Creek site by Agasicles and at several other sites in the southeastern states. The feeding of the Agasicles on alligator weed decreases its ability to compete with other aquatic plants. Other insects may be used to extend control over a greater geographic area. This report summarized research studies on the aquatic problem plant alligator weed, exploration for its natural enemies, introduction and distribution of insect enemies, and the evaluation of biological control effects. Details of these studies were contained in appendixes. (Sims-ISWS)

SOIL SALINITY DISTRIBUTION IN SPRINKLER AND SUBSURFACE-IRRIGATED CITRUS,
Brigham Young Univ., Provo, Utah.
S. D. Nelson, and S. Davis.
Transactions of the ASAE (American Society of Agricultural Engineers) Vol 17, No 1, p 140-143, January-February 1974. 4 fig, 3 tab, 4 ref.

Descriptors: *Saline soil, *Salinity, *Sprinkler irrigation, *Subsurface irrigation, *Citrus fruits, Leaching, Irrigation practices, Irrigation effects, Irrigation systems, Irrigation, Agriculture, Irrigation efficiency, Soil-water-plant relationships, Soil salinity.
Identifiers: *Trickle irrigation, *Drip irrigation.

Soil salinity distribution produced by subsurface irrigation results in maximum salt concentrations at the perimeter of the wetting front. The soil salinity increases most in the soil above the burial depth of the subsurface pipe. Winter rainfall could be effectively used to leach accumulated surface salts from the root zone of subsurface--irrigated citrus in southern California, by maintaining a high water content during the rainfall months, allowing precipitation to be used only for leaching and not for increasing the soil water content. By using this management method, a more favorable salt balance was maintained. (Skogerboe-Colorado State)

Descriptors: *Leaching, Sprinkler irrigation, Surface irrigation, Salinity, Irrigation practices, Irrigation effects, Irrigation operation and management, Irrigation water, Barley, Crop production, Irrigation, Agriculture, Saline soils.

Applying excess irrigation water to a winter barley crop can be used to leach salt from the soil at the same time crop production is proceeding. Surface irrigation and sprinkler irrigation were equally effective in leaching salt from the soil during a barley season. Application of more water between the drains than near the drains with sprinklers improved but slightly the salt removal between the drains in the top foot of soil and gave no greater improvement at a depth of 4 to 5 feet. Application of 30% excess water with surface irrigation and 67% excess water with sprinklers produced good barley yields. (Skogerboe-Colorado State)

HYDROGEOLOGY ALONG THE PROPOSED BARRIER-RECHARGE-WELL ALINEMENT IN SOUTHERN NASSAU COUNTY, LONG ISLAND, NEW YORK,
Geological Survey, Mineola, N. Y.
H. F. H. Ku, J. Vecchioli, and L. A. Cerrillo.
For sale by USGS, Reston, Va 22092, Price $1.00. Hydrologic Investigations Atlas HA-502, 1975. 1 sheet, 18 ref.

Descriptors: *Hydrogeology, *Groundwater movement, *Saline water barriers, *Injection wells, *New York, Hydrologic data, Water pollution control, Aquifer characteristics, Maps, Petrology, Subsurface investigations.
Identifiers: *Nassau County(NY), Magothy aquifer.

In Nassau County all fresh-water supplies are derived from groundwater sources, of which the Magothy is the principal aquifer. The suitability of the hydrogeologic environment of the Magothy Aquifer is evaluated for development of a hydraulic barrier to retard or halt salt-water intrusion into the aquifer. The barrier would consist of a line of wells through which reclaimed water (highly treated sewage-plant effluent) would be injected into the Magothy Aquifer. A summary of the hydrogeology of the Magothy Aquifer and overlying and underlying units in southern Nassau County is tabulated and pertinent data are shown on a hydrogeologic map. The proposed location of the recharge barrier, about 1 mile south of Sunrise Highway, seems reasonable in that it: (1) is south of any public-supply wells that tap the Magothy Aquifer and (2) is within that part of the Magothy Aquifer confined by overlying Pleistocene clay units. The confinement provided by the overlying Pleistone clay units would greatly inhibit vertical dissipation of the recharge head beyond the top of the Magothy and would lead to maximum effectiveness of the hydraulic barrier. (Woodard-USGS)

LAND SUBSIDENCE DUE TO GROUNDWATER WITHDRAWAL IN THE LOS BANOS-KETTLEMAN CITY AREA, CALIFORNIA: PART 1.CHANGES IN THE HYDROLOGIC ENVIRONMENT CONDUCTIVE TO SUBSIDENCE,
Geological Survey, Reston, Va.
W. B. Bull, and R. E. Miller.
Supt. of Documents, GPO, Wash., D. C. 20402 Price $2.05. Professional Paper 437-E, 1975. 71 p, 47 fig, 3 tab, 28 ref.

Descriptors: *Land subsidence, *Groundwater, *Withdrawal, *Hydrogeology, *California, Geology, Aquifer characteristics, Hydrologic data, Pumping, Water wells, Water yield, Water levels, Geomorphplogy, Groundwater movement, Groundwater recharge, Water demand.
Identifiers: *Los Banos-Kettleman City Area(Calif).

About 500 to 2,000 feet of unconsolidated flood plain, alluvial-fan, lacustrine, deltaic, and marine deposits are compacting at accelerated rates because of man's changes in the hydrologic environment in the west-central San Joaquin Valley, Calif. Groundwater pumping has increased the stresses tending to compact the deposits by as much as 50 percent. Three basic hydrologic units comprise the groundwater reservoir between Los Banos and Kettleman City. An upper-zone aquifer system, 100-900 feet thick, extends from the land surface to the top of the second unit. It is a lacustrine confining clay. The upper zone consists mainly of poorly permeable alluvial-fan deposits derived from the Diablo Range that contain semiconfined water of poor quality. The lacustrine aquiclude, the Corcoran Clay Member of the Tulare Formation, extends beneath the entire study area except for the southwestern part adjacent to the Diablo Range. The third hydrologic unit, the confined aquifer system of the lower zone, supplies about three-fourths of the groundwater pumped and is the zone in which 50-95 percent of the compaction causing the subsidence occurs. The lower zone consists mainly of flood deposits in the northern part, alluvial-fan deposits in the southern part, and diverse continental to marine deposits in the central part of the area. STEP-DRAWDOWN TEST ANALYSIS BY COMPUTER,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. W. Labadie, and OJ J. Helweg.
Ground Water, Vol 13, No 5, p 438-444, September-October 1975. 5 fig, 3 tab, 17 ref.

Descriptors: *Groundwater, *Turbulent flow, *Water wells, *Optimization, *Computer programs, Aquifer characteristics, Aquifer testing, Turbulence, Drawdown, Well data, Transition flow, Testing, Anlytical techniques, Least squares method, Discharge(Water), Pumping.
Identifiers: Step-drawdown test, Step test, Well loss, Well efficiency, Effective well radius, Pump test.

Many geohydrologists believe that the step-drawdown test is useful in determining many important characteristics of a well, whereas others altogether question its utility. In addition to this controversy, its application is hindered because the graphical analysis of data is unwieldy. A computer was presented for step-drawdown test analysis which is efficient and simple to use; moreover, it was an example of how optimization could be used in a practical way. A listing of the FORTRAN code was included along with some example calculations. The computer program generates least-squares fitting to step-test data to produce values of B, C, and P of the drawdown equation BQ plus CQ to the Pth power. (Prickett-ISWS)

4C. Effects On Water Of Man's Non-Water Activities

QUANTITATIVE TECHNIQUES FOR EVALUATING THE ENVIRONMENTAL IMPACT OF TRANSPORTATION SYSTEMS,
Sydney Area Transportation Study (Australia).
T. R. Mongan, R. S. Nielsen, and N. J. Nielsen.
Royal Australian Planning Institute Journal, Vol 11, No 4, p 135-142, October 1973. 9 ref.

Descriptors: *Transportation, *Environment, *Evaluation, Water pollution, Solid wastes, Air pollution, Social aspects, Pollutants, Estimating.
Identifiers: *Environmental impact, *Quantitative techniques, Social disruption, Noise pollution, Urban areas.

The size and cost of transportation systems have grown so large and the time periods needed to amortize the investment have become so long that the detrimental effects of these systems on the urban environment are likely to be particularly long-lived. In evaluating a transportation system, it is necessary to weigh the detrimental environmental impact of the system against the convenience and economic stimulation which the system is expected to produce. Most detrimental environmental impacts of transportation systems can be classed as pollution or social disruption. Presented are some methods for preparing quantitative estimates of these two classes of environmental impacts which have been developed for the Sydney Area Transportation Study and appear to be generally applicable. In developing these esti-

LIBRARY U. OF I. URBANA-CHAMPAIGN

mates, two basic questions are posed: (1) What are the actual physical effects of a given system on the environment; and (2) What are the levels at which these effects are undersirable or harmful. The first question, which is a scientific and technical one requiring the assistance of technical specialists to answer it is discussed. (The second question is one of values.) Some of the main emission sources leading to high pollutant concentration in large urban areas are transport related. The emissions from transportation system components can cause air, noise, solid waste, and water pollution; each of these problems is considered at it relates to transport technology. Road, rail, air, and water-borne transport are discussed. (Bell-Cornell)

COMPUTER PROGRAM FOR DRAINAGE QUANTITIES,
T. Williams.
Surveyor, Vol 141, No 4207, p 38-41, January 26, 1973. 7 fig.

Descriptors: *Model studies, *Computer programs, *Sewers, *Drains, Storm drains.

The majority of road contracts prepared in the United Kingdom conform to the model contract document for highway works contracts of the Department of the Environment. The standardized way in which drainage information has to be presented is particularly suited to the use of a computer which also reduces repetitive error-prone manual operations. A suite of programs has therefore been written which include KIDD2, BILL, MHOLE, and MHBILL. KIDD2 produces printed output in the form of sewer schedules and gutter schedules, together with punch cards for use as input to BILL. BILL takes as input cards produced from one or more runs of KIDD2 plus any punched manually, and gives a print-out in the form of bill of quantity items. MHOLE uses the same basic card input as KIDD2, yielding printed output in the form of a manhole schedule sorted according to type, together with punched cards for MHBILL. MHBILL accepts cards produced from one or more runs of MHOLE plus any punched manually, and provides print-out in the form of bill of quantity items. The KIDD2 program does the working-up required for sewers and gutter connections. It handles any number of these in the same run by the use of separate subroutines, control being transferred to the appropriate subroutine or returned to the main program by signal cards. The BILL program combines the manual operations of abstracting and billing. It also calculates the average depth and selects the maximum depth for each item. At the same time, it counts the numbers of each kind of gutter connection, and the numbers of junctions of these connections with storm sewers of each size. The purpose of the MHOLE program is to identify each sewer terminal and to calculate and record its name, type, and its depth and volume. The MHBILL program replaces the manual tasks of abstracting and billing, its main function being that of sorting. It uses as input 44-cards output from one or more runs of MHOLE together with any punched manually. (Sandoski-FIRL)

URBANIZATION IMPACT ON WATER QUALITY DURING A FLOOD IN SMALL WATERSHEDS,
Wisconsin Univ., Milwaukee, Dept. of Geological Sciences.
D. S. Cherkauer.
Water Resources Bulletin, Vol 11, No 5, p 987-998, October 1975. 6 fig, 4 tab, 19 ref.

Descriptors: *Urban runoff, *Water quality, *Streamflow, *Rural areas, *Wisconsin, Peak discharge, Land use, Floods, Suspended solids, Sodium, Chlorides, Calcium, Magnesium, Bicarbonates, Urbanization, Hydrology.
Identifiers: Brown Deer Creek(Wis), Trinity Creek(Wis), Milwaukee(Wis).

The impact of various urban land uses on water flow and quality in streams is being studied by monitoring small streams in the Milwaukee urban area. The responses of an urban watershed and an agricultural watershed to an autumn rainfall of 2.2 cm were compared. Flow from the urban basin showed a substantially greater response to the rain than that from the rural. Dilution, resulting from the greater quantities of surface runoff in the urban watershed, caused lower concentrations of sodiut. , chloride, calcium, magnesium, bicarbonate, and total dissolved solids in the urban stream. The total quantity of these materials removed per unit drainage area of the urban basin was much greater, however. Road salt was still among the dominant dissolved materials in the urban water chemistry seven months after the last road salting. Sodium was apparently being released from adsorption by clays in the urban basin. Suspended sediment concentrations and total loads were higher in the urban stream. (Lardner-ISWS)

HYDROLOGY OF BLACK MESA WATERSHEDS, WESTERN COLORADO,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, Colo.
E. C. Frank, H. E. Brown, and J. R. Thompson.
USDA Forest Service, General Technical Report RM-13, June, 1975. 11 p, 8 fig, 6 ref, 4 tab.

Descriptors: *Hydrology, *Watersheds(Basins), *Surface runoff, *Suspended load, Sediments, Water pollution sources, Colorado, Runoff, Sediment yield, Storm runoff, Soil erosion, Precipitation(Atmospheric), Streamflow, Grazing, Water supply, Water quality, Grasslands.
Identifiers: Black Mesa(Colorado).

For 11 years, precipitation, streamflow, and sediment were measured from three small watersheds on Black Mesa in the mountain grasslands of western Colorado to obtain information about hydrologic processes. Runoff and suspended sediment data show no relationship to bare soil intercept. This lack of relationship is probably due to the experimental error in measuring these small amounts of sediment. Bare intercept decreased on each watershed during the 1957-1967 period, even though grazing utilized an average of 40% of the grass in the open parks on one of the watersheds. While suspended-sediment concentration after summer storms can be as much as 6 times tha sampled during snowmelt, total yield averages 9 lb/acre from spring runoff and 11 lb/acre from storm runoff because of the small volume of flow Based on current erosion classification schemes these are very minor amounts of geologic erosion (Witt-IPC)

DETERMINATION OF URBAN WATERSHED RESPONSE TIME,
Colorado State Univ., Fort Collins.
E. F. Schulz, and O. G. Lopez.
No 71, Hydrology Papers, Colorado State University, Fort Collins, Colorado, December 1974. 41 p 8 fig, 12 tab, 96 equ, 74 ref, 2 append.

Descriptors: *Urban hydrology, *Watersheds(Basins), *Floods, *Unit hydrographs, Storms, Rainfall, Runoff, Networks, Data processing, Correlation analysis, Drainage, Equations, Systems analysis, Planning, Colorado.
Identifiers: Stepwise multiple regression, Parameters of urbanization, Lag time, Response time, Denver(Colo), Linear regression.

Urban engineers are plagued by many problems related to hydrology. On e of these is flooding and the design of storm water drainage. Accompanying the frequent flooding are the tendency of the water courses to deteriorate and problems of sedimentation. Reported is a study which has developed correlations between flood hydrograph parameters and physical features unique to the urban watershed. After a review of previous work and a discussion of different methods for quantifying urbanization, a stepwise multiple regression technique was used to select the best parameter of urbanization. The rainfall and flood events from nine urban watersheds in the Denver Metropolitan region were analyzed. Unit hydrographs were derived from the measured floods on these watersheds, and the unit hydrograph parameters were correlated with storm and physical watershed parameters. It was found that the changes in the unit hydrograph in the urban region were related to the decrease in the watershed response time. The best way of defining the response time was the lag time. The lag time was found to be sensitive to the increase in the hydraulic capacity, to the decrease in the ratio of previous watershed, and to the shape of the watershed. (Bell-Cornell)

ENVIRONMENTAL RECONNAISSANCE TECHNIQUES FOR CONNECTICUT RIVER BASIN WATERSHEDS,
Center for the Environment and Man, Inc., Hartford, Conn.
D. R. Zoellner, and G. M. Northrop.
Available from the National Technical Information Service Springfield, Va 22161 as PB-238 497, $5.00 in paper copy, $2.25 in microfiche. Prepared for the Connecticut River Basin Program, New England River Basins Commission, Boston, Massachusetts. Final report No CEM 4155-498, March 1974. 96 p, 7 fig, 16 tab, 27 ref, append. CRSS-NERBC 1.6B.

Descriptors: *Watershed management, *River basins, Methodology, *Environmental effects, *Flood damage, Flood protection, Water quality, Flood plains, Erosion, Drainage patterns(Geologic), Soils, Sedimentation, *Connecticut River.
Identifiers: *Ecological profiles, *Environmental impacts, *Connecticut River Basin, Mill River(Mass), Black River(Vt), Northhampton(Mass), Springfield(Vt), Flood management alternatives.

Methods are delineated for performing in a short period of time an environmental reconnaissance of a Connecticut River Basin (CRB) watershed, which will result in enough information to assess

he impacts that would raise from various flood-damage reduction alternatives. From the study of he Mill River and Black River watersheds, some general rules are developed for such studies, and research needs are identified. For an adequate study of Connecticut River Basin watershed the following are necessary: (1) an environmental profile that establishes the natural and manmade characteristics, presents a framework for information and identifies information sources; (2) a matrix approach for arraying flood management alternatives against watershed characteristics. Some of the more salient features that determine he present environmental characteristics of streams are: area, topography, climatology, soil conditions, vegetation and urban-rural development; location function and condition of existing man-made impoundments; man-oriented past and present stream uses with emphasis on pollutants; present status of diversity and productivity of stream life. The matrix approach for flood management alternatives lists alternative functional activities vertically on the matrix and natural environment characteristic horizontally. The latter consists of Sectors which is a physical category, Elements which are physical subdivisions of the natural sectors, Characteristics of the Elements, and Functional Activities which is the behavior of the entities in carrying out their natural functions. The report lists envrionmental impacts associated with reservoir projects and flood damage reduction projects. (Smith-North Carolina)

SEDIMENT ROUTING FOR AGRICULTURAL WATERSHEDS,
Agricultural Research Service, Temple, Tex.
J. R. Williams.
Water Resources Bulletin, Vol 11, No 5, p 965-974, October 1975, 6 tab, 16 ref.

Descriptors: *Sediment yield, *Agricultural watersheds, *Soil erosion, *Settling velocity, *Texas, Sheet erosion, Rill erosion, Gully erosion.
Identifiers: *Universal soil loss equation, Sediment routing.

A sediment routing technique was developed to route sediment yield from small agricultural watersheds (less than or equal to 10 sq mi) through streams and valleys to the outlet of large watersheds (less than or equal to 1000 sq mi). The procedure was based on the modified universal soil loss equation and a first order decay function of travel time and particle size. Deposition was dependent upon settling velocities of the sediment particles, travel time, and the amount of sediment in suspension. Sediment routing increases sediment yield prediction accuracy and allows determination of subwatershed contributions to the total sediment yield. Also the locations and amounts of floodplain scour and deposition can be predicted. Another advantage of sediment routing is that measured sediment yield data are not required. The procedure performed satisfactorily in test routings on two Texas blackland watersheds. More tests were planned with data from other physiographic areas. (Bhowmik-ISWS)

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

A CHARACTERIZATION OF THE EFFLUENT FROM COMMERCIAL CATFISH PONDS,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
D. B. Beasley, and J. B. Allen.
Presented at 67th Annual Meeting, American Society of Agricultural Engineers, Oklahoma State University, Stillwater, June 23-26, 1974; Paper No. 74-5004, 28 p. 16 fig, 5 tab, 9 ref.

Descriptors: *Effluents, *Fish farming, *Farm wastes, Water sampling, Ponds, Biochemical oxygen demand, Nutrients, *Chemical analysis, Catfishes, Fish stocking.
Identifiers: *Commercial catfish ponds, Total solids.

This investigation was carried out to obtain a meaningful chemical and biochemical characterization of the effluent from commercial catfish ponds. The water samples were taken from commercial catfish ponds in both the Mississippi and Arkansas Delta areas. The ponds ranged in size from 10 to 40 acres and the stocking rates included 1800, 2000, and 3000 fish per acre. All of the ponds were sampled on the surface, and one pond at each stocking rate was also sampled at the bottom. This data was arranged in order to compare both the differences in stocking rates and the difference in sampling depths. The water quality in the ponds monitored usually met or exceeded standards set forth for recreational waters by the Mississippi Air and Water Pollution Control Commission. In a majority of cases, the values of most of the parameters obtained from samples taken from the bottom of these ponds was slightly higher than corresponding values obtained from samples taken at the surface. Also, the ponds stocked at higher rates usually had slightly higher values of BOD, nutrients, and total solids. (Cartmell-East Central Oklahoma State)
W76-01041

METAL ANALYSIS BY MODEL 630-C HITACHI LIQUID CHROMATOGRAPH (630-C-GATA HITACHI EKITAI KUROMATOGRAPHU NI YORU KINZOKU BUNSEKI),
T. Hamano, and Y. Takata.
Hitachi Hyoron, Vol 55, No 2, p 21-25, February, 1973. 10 fig, 3 ref.

Descriptors: *Analytical techniques, *Heavy metals, Pollutant identification, Saline water, Industrial wastes, Potable water, Industrial water, Boiler feed water, Hardness(Water).
Identifiers: Japan, Liquid chromatography, Electrolytic cells, River water.

The Hitachi Company of Japan has developed a new liquid chromatograph, Model 630-C, using stable electric potential coulometry for analysis of heavy metals. In using this apparatus, when the reaction reaches a given point electrolysis of these metals is completed and analysis is quick. Also, selective reactions are possible using electrolytic potential differences, high sensitivity can be expected, an absolute determination of quantity is possible, calibration curves are not necessary, and the results are not affected by the temperature or the consistency of the liquid. The structure of the apparatus is such that the column solution passes through the electrolytic cell, and the elements in the solution complete electrochemical reaction while passing the cell. If the flow speed is stable, the electric current will show the concentration of the material in the solution. By changing the resin packing of the separation column and the column temperature, the position of analysis may be changed in order to avoid overlapping and 5 to 6 elements can be analyzed in 30 to 40 minutes. This method is applicable to heavy metal ions in saline water or river water, for analysis of liquid waste from industries, and hardness analysis of drinking, industrial, or broiler water. (Sandoski-FIRL)

ANODIC STRIPPING VOLTAMMETRY WITH THE FLORENCE MERCURY FILM ELECTRODE DETERMINATION OF COPPER, LEAD AND CADMIUM IN SEA WATER,
Oslo Univ. (Norway). Dept. of Chemistry.
W. Lund, and M. Salberg.
Analytica Chimica Acta, Vol 76, No 1, p 131-141, May, 1975, 5 tab, 5 fig, 17 ref.

Descriptors: *Analytical techniques, *Heavy metals, *Sea water, *Trace elements, Volumetric analysis, Model studies, Electrodes, *Copper, Lead, Cadmium, Mercury.
Identifiers: *Voltammetric technique, *Ligands, Complexes.

The determination of trace metals in sea water is an important application of stripping voltammetric technique. Cu, Pb, and Cd were chosen to analyze in a model system for the critical evaluation of the technique. The analyses were carried out at a pH of 8 in the absence of added chemicals, using the rotating glossy carbon electrode mercury plated in situ for anodic stripping voltammetry. The choice of electrode material, effect of instrumental parameters on the stripping response, and sensitivity of the complex-forming ligands are discussed. The performance of the film electrode is compared to that of the hanging Hg drop electrode. (Delfiner-Vanderbilt)

A NOTE ON THE EFFECT OF CHEMICAL TREATMENTS IN THE MINERALOGICAL STUDIES OF SEDIMENTS,
McGill Univ., Montreal (Quebec). Marine Sciences Centre.
V. Subramanian.
Experientia, Vol 31, No 1, p 12-13, January 15, 1975. 1 fig, 1 tab, 6 ref.

Descriptors: *Heavy metals, *Iron, *Mineralogy, *Sediments, *Radiation, Chemical reactions, Sodium compounds, Pollutant identification, Chemical properties, Clay minerals, Kaolinite, Illite, Montmorillonite, X-ray diffraction, Atlantic Ocean.
Identifiers: Mossbauer spectra, Velocity-absorption spectra, Metallic coatings, Amazon River.

Changes were observed brought about by chemical pretreatment in the Mossbauer spectra of natural sedimenta samples. X-ray and other analytical tools were used. Sediment samples are commonly treated with Nacitrate, Na-bicarbonate and Na-dithionite to remove metallic coatings, and with H_2O_2 to break up the organics. A sediment sample was collected from the Atlantic Ocean off the mouth of the Amazon River, which consisted of

LIBRARY U. OF I. URBANA-CHAMPAIGN

equal amounts of kaolinite, illite, and montmorillonite. Mossbauer effect was observed on both treated and untreated sediment. The data obtained were computer fitted to obtain the velocity-absorption (intensity) spectra. The data indicate that the chemical treatment affects the basic structure of the silicates, in addition to removing some, but not all of the iron in the coatings. It is most likely that the structural changes occur in the montmorillonite fraction. These results indicate that the usefulness of chemical pretreatment for mineralogical studies needs to be re-evaluated. (Davis-Vanderbilt)
W76-01109

MEASUREMENT OF ZOOPLANKTON BIOMASS BY CARBON ANALYSIS FOR APPLICATION IN SOUND SCATTERING MODELS,
Naval Postgraduate School, Monterey, Calif.
J. C. Radney.
Available from the National Technical Information Service, Springfield, Va 22161 as AD/A-001 294, $5.50 in paper copy, $2.25 in microfiche. Master's thesis, September 1974, 122 p. 39 fig, 5 tab, 45 ref.

Descriptors: *Measurement, *Zooplankton, *Biomass, *Carbon, *Analytical techniques, Acoustics, Methodology, Sonar, Oceans.
Identifiers: LECO Carbon Analyzer, Benzoic acid, Casein, Tigriopus californicus, Monterey Bay(Calif), Sound scattering.

Organic carbon analysis is a simple, reliable test of marine organism (zooplankton) biomass. The LECO Carbon Analyzer which employs high temperature dry combustion and a thermal conducting sensor was adapted for determining total carbon. Analysis was rapid (70 seconds), consistent (plus or minus 3%) consistent (plus or minus 3%). Less than 71 mg of carbon in benzoic acid or casein could be measured. Biomass measurement using carbon analysis was tested by determining the carbon content in a marine copepod, Tigriopus californicus; the mean carbon content was 38.6% freeze-dried weight. The mean adenosine triphosphate-carbon to total carbon ratio in T. californicus was 0.2634%; this was used to determine living biomass of field net samples. Zooplankton were considered to be indigenous above 200 m and distributed in patches dependent on space and time. Estimates of total, living, and dead biomass by carbon analysis and ATP measurements showed definite seasonal trends in Monterey Bay, California. Standard curves of the LECO Carbon Analyzer should be verified with other standards. Collection and freeze-drying techniques need to be improved. Diurnal and multi-day studies are suggested. Acoustic measurements should be made in the same region to test the application of zooplankton biomass measurements to sound scattering. (Buchanan-Davidson--Wisconsin)

Descriptors: *Analytical techniques, *Toxicity, *Bacteria, Effluents, Water, Biochemical oxygen demand, Pollutants.
Identifiers: Mutations, Aeromonas hydrophila.

A spontaneous mutant of Aeromonas hydrophila, a species which is characteristic of the effluent-surface water biotype and is fairly sensitive to toxic substances, has been examined as a method for testing pollutant toxicity to bacterial organisms. In the investigation, mutant growth inhibition by the pollutant in BOD dilution water containing 10 to the minus 5th power percent vitamin-free hydrolyzed casein served as a measure of toxicity. A culture of the mutant in the treated BOD dilution water served as a control. Investigations of samples for toxicity are possible due to the specific properties of the mutant. (Sandoski-FIRL)

AIRBORNE DETECTION AND MAPPING OF OIL SPILLS, GRAND BAHAMAS, FEBRUARY 1973,
Canada Centre for Remote Sensing, Ottawa (Ontario) Data Acquisition Div.
J. N. de Villiers.
Available from the National Technical Information Service as PB-238 841, $3.50 in paper copy, $2.25 in microfiche. Data Report 73-7 (Formerly 73-16), September 1973. 18 p, 7 fig.

Descriptors: *Remote sensing, *Oil spills, *On-site investigations, *Pollutant identification, Aerial photography, Instrumentation, Photography, Water pollution sources, Oil, Infrared radiation, Measurement, Mapping, *Path of pollutants.
Identifiers: *Grand Bahamas, Naptha, Louisiana crude oil, Laser fluorosensor.

An airborne exercise employing various sensors to investigate their ability to detect and map Louisiana Crude and Naptha oil spills, both by day and by night, was described. It was shown that photographic, infra-red scanning and low light level T.V. all have some ability to detect Louisiana Crude; only infra-red scanning detected naptha. None of these sensors could identify the anomalies as oil. Sampling the anomaly from a boat or use of other sensing techniques (such as fluoro-sensing) was needed to identify the anomaly positively as oil. A laser fluorosensor showed promise in detecting oil at night. Further development will be needed to explore the full potential of such a technique. (Humphreys-ISWS)

METHODS AND DATA REQUIREMENTS FOR RIVER-QUALITY ASSESSMENT,
Geological Survey, Portland, Oreg.
D. A. Rickert, W. G. Hines, and S. W. McKenzie.
Water Resources Bulletin, Vol 11, No 5, p 1013-1039, October 1975. 5 fig, 1 tab, 32 ref.

Descriptors: *Water resources, *Planning, *Management, *River basins, *Water quality, Dissolved oxygen, Communication, Simulation analysis, Mathematical models, Mapping, Systems analysis, Decision making, *Oregon, Environmental effects.
Identifiers: *Environmental impact assessment, Data programs, *Willamette River basin(Oregon).

The U.S. Geological Survey is conducting an intensive river-quality assessment of the Willamette River basin, Oregon. The objectives are to (1) define a practical framework for conducting comprehensive river-quality assessments, (2) develop and document methods for evaluating basin-development alternatives in terms of potential impacts on river quality, (3) determine the kinds and amounts of data required to adequately assess various types of river quality problems, and (4) apply the framework, data, and methods to assess the existing or potential river-quality problems of the Willamette River basin. Considered herein are objectives 2, 3, and 4, by examining the rationales behind the selection and application of methods and the design of data programs for assessing specific river-quality problems. The rationales are those developed for assessing (1) the effect of population and industrial growth and resulting waste discharges on river-dissolved oxygen, (2) the potentially harmful effects on land and river quality of accelerated erosion resulting from intensive land-use development, and (3) the potential for nuisance algal growth. The goal of the assessment program and, thus, the context of the rationales is to provide technically sound information that is appropriate and adequate for resource planning and management. A SYSTEMS ANALYSIS OF A CONTINUOUS WATER QUALITY MONITORING PROJECT,
Tennessee Univ., Knoxville. Water Resources Research Center.
R. E. Cronmiller.
Available from the National Technical Information Service Springfield, Va 22161 as PB-246 846, $4.50 in paper copy, $2.25 in microfiche. Research Report No 38, August 1974. 9 fig, 6 tab, 7 ref, 53 p. OWRT A-022-TENN(1).

Descriptors: *Water quality, *Monitoring, *Projects, Reservoirs, Tennessee River, Systems analysis, Equipment, Design, Operations, Reliability, Costs, Pumping, Economics, Installation, Telemetry, Personnel, Management.
Identifiers: Cost projection.

With the increased pollution potential of our waters, any water quality program should include continuous monitoring as a means of evaluating the environmental conditions of a water body. Such a procedure accurately measures and records chosen parameters at specified time intervals and location(s), primarily for achieving the objectives of pollution prevention and/or abatement. This paper reports on an investigation of the equipment, personnel, installation, and operation of a continuous water quality monitoring project at Fort Loudon Reservoir on the Tennessee River. The equipment options that were initially considered for the project are discussed in some detail in a state of the arts review. Considered also are some of the most popular system designs currently being employed today. The latter part of the study is concerned with a systems analysis of the project. Equipment design and operation are mentioned as the key factors in determining the overall success of a monitoring system. A cost projection of the project for a three-year duration and a comparison of these costs revealed that for a suitable monitoring system yielding reliable data, the operational functions will account for a major portion of the costs incurred. WATER POLLUTION MONITORING SYSTEM, (IN JAPANESE),
M. Matsuda, and Y. Takeda.
Nippon Denki Giho, (Technical Report of Nippon Electric Co.), No 2, p 73-81, March, 1975. 6 fig, 2 tab, 3 ref.

Descriptors: *Monitoring, *Water pollution, *Computers, Analytical techniques, *Pollutant identification, Heavy metals, Biochemical oxygen demand, Rivers, Lakes, Sewerage, Chemical oxygen demand, Data collections.

A system consisting of water pollution monitoring stations where data are collected on-line, and of a central monitoring station to which recorded cassette tapes are supplied for computer input has been developed in Japna. The stations are set up on rivers and lakes, ar sea, and at the point of plant sewerage discharge. Data obtained at the monitoring stations include pollutant concentrations, water temperature, flow rate, oxidation-reduction potential, and electric conductivity. Pollutants included cadmium and Cd compounds, cyanides, organic phosphorus compounds, lead and Pb compounds, Cr(VI) compounds, arsenic and As compounds, mercury and Hg compounds (including alkylmercury), suspended solids, phenols, Cu, Zn, soluble Mn, n-hexane extracts, flurides, coliform-group bacteria and BOD and COD. These were measured by standard Japanese (JIS) methods. Data were integrated at the central monitoring station by on-line, background, off-line, and backup computer operations. (Su-FIRL)

Y. Ishihara, K. Tanaka, and H. Sunahara.
Mizushori Gijutsu, (Water Purification and Liquid Wastes Treatment), Vol 16, No 7, p 659-662, July, 1975. 5 fig, 1 ref.

Descriptors: *Measurement, *Analytical techniques, *Activated sludge, *Turbidity, Suspended solids, Pollutant identification, Waste water treatment.
Identifiers: Mixed liquor suspended solids(MLSS), Turbidimeters.

A pre-determined quantity of mixed activated sludge solution was sampled and diluted with water to a specified volume. After rapid stirring, the turbidity of the solution was measured by an integrated spherical type turbidimeter. The activated sludge in the solution was determined by a conventional method and a calibration curve was constructed. A standard solution of kaolin was used for the calibration of the turbidimeter. Results showed that both SEP-TW model and SEP-PT model turbidimeters gave satisfactory reproducibility and sensitivity. An ultra-sound wave method and a high speed mixer were found to give a homogeneously dispersed solution of activated sludge; a constant turbidity was obtained after 30 minutes of standing. Activated sludge at concentrations of up to 10,000 ppm can be measured by the turbidity method and any coloration of the sample solution with metal ions from zero to eight percent in concentration has no apparent effect on the determination. HEAT DISPOSAL IN THE WATER ENVIRONMENT,
Massachusetts Inst. of Tech., Cambridge. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics.
D. R. F. Harleman.
Journal of the Boston Society of Civil Engineers Section, American Society of Civil Engineers, Vol 61, No 3, p 99-123, July 1974. 11 fig, 21 ref.

Descriptors: *Heat, *Disposal, *Water, *Environment, *Water quality, Temperature, Laboratory tests, Mathematical models, Analytical techniques, Diffusion, Buoyancy.
Identifiers: Prediction, Buoyant jets, Field observations.

The need for continuing development of techniques for predicting temperature distributions due to waste heat discharges into lakes, rivers, estuaries and the oceans is discussed. Emphasis is on the interactive role of basic laboratory experiments, analytical and numerical techniques and field observations. Diffusion of buoyant jets is discussed, including heated surface jets and multiple jets issuing from a submerged multiport diffuser. In the near-field analysis of surface jets the important problems are related to the lateral spreading caused by buoyancy. Comparison of theoretical predictions with laboratory and field observations is given. The mechanics of multiport diffusers for heated discharges in shallow receiving waters are discussed in contrast to sewage diffusers. The important problem is the degree to which stratification can be maintained in order to minimize local reintrainment and reduction of dilution capacity. Criteria for stable and unstable flow regimes are provided. A mathematical model for temperature distribution, with or without waste heat addition, in unsteady flows under time-varying meteorological conditions is given. Predictive techniques are needed in the preparation of environmental impact statements for pre-operational site studies in order to evaluate the economic and environmental costs of alternative cooling water system. PHOSPHORUS IN THE RURAL ECOSYSTEM--RUNOFF FROM AGRICULTURAL LAND,
Wisconsin Univ., Madison.
R. Powell, and J. Densmore.
In: Proceedings of Conference on Farm Animal Wastes, Nitrates and Phosphates, in Rural Wisconsin Ecosystems, Madison, Green Bay, and Eau Claire, Wisconsin, February 1-5, 1971, p 156-166. 9 tab, 1 ref.

Descriptors: *Phosphorus, *Agricultural runoff, Water pollution sources, Soil erosion, Fertilizers, Farm wastes, Ecosystems, Runoff.
Identifiers: Manure.

Public concern over pollution of the environment has increased considerably. Concern about water quality is foremost because the main result is visible degradation of the water, namely the growth of algae and weeds plus possible contamination of drinking water supplies. Estimates show that less than one-third of the phosphorus entering Wisconsin waters comes from agricultural land. Agricultural sources of phosphorus are mainly soil erosion, fertilizers and manures. Applications of these products on snow covered, sloping fields can be potential sources of phosphorus pollution. Incorporation of animal manures immediately after application conserves the nutrients and also reduces the soil erosion potential of a sloping field. Judicious placement of intensive feeding operations and careful handling of fertilizers and animal wastes will help to foster public relations between agriculture and her urban neighbors. PHOSPHORUS IN OUR ENVIRONMENT,
Wisconsin Dept. of Natural Resources, Madison.
J. M. Cain, and J. E. Kerrigan.
In: Proceedings of Conference on Farm Animal Wastes, Nitrates and Phosphates, in Rural Wisconsin Ecosystems, Madison, Green Bay, and Eau Claire, Wisconsin, February 1-5, 1971, p 134-137. 5 ref.

Descriptors: *Phosphorus, *Fertilizers, Surface waters, Environment, Wisconsin, Nutrients, Water pollution sources, Soil erosion, Waste treatment.
Identifiers: *Manure.

Historical background, characteristics, and principal producers of phosphorus are discussed. A major concern is the increased concentration of phosphorus in surface waters. Manure and commerical fertilizers are the major sources of plant nutrients in Wisconsin. Estimates show that 48 percent of the total phosphorus supplied to Wisconsin crops was from manure. Much of the manure was applied on frozen ground so that it contributed significant quantities of soluble phosphorus to the spring runoff. Complications to the problem of phosphorus imbalance in the environment include such factors as the broad expanses of land and water involved, the low phosphorus concentrations at which problems occur in lake waters and the abundance and low cost of phosphorus which often preclude profitable recovery of phosphorus. The phosphorus problem must be considered as part of a group of interrelated problems of soil erosion, nitrogen fertilization, waste treatment, water use, and land use. SOURCES AND FATE OF 'AVAILABLE' NITROGEN IN RURAL ECOSYSTEMS,
Wisconsin Univ., Madison.
D. R. Keeney, and L. M. Walsh.
In: Proceedings of Conferences on Farm Animal Wastes, Nitrates and Phosphates in Rural Wisconsin Ecosystems, Madison, Green Bay, and Eau Claire, Wisconsin, Feb 1-5, 1971, p 22-40, 4 fig, 8 tab.

Descriptors: *Nitrogen, *Nitrates, *Runoff, *Groundwater pollution, Rural areas, Ecosystems, Crops, Soils, Nitrogen compounds, Water pollution sources, Agricultural runoff.
Identifiers: Manure.

The most critical problem associated with nitrogen compounds in groundwater aquifers is the possible adverse health effects on humans and animals. All sources od nitrogen--precipitation, crop residues, soil organic matter, legumes, manure, and nitrogen fertilizer--are ultimately converted to the leachable NO3-N form by soil bacteria. Nitrogen can be lost from the soils by crop removal, leaching, denitrification, and runoff. Losses of soil material and total nitrogen are directly related to amount of runoff. Practices recommended for reduction of runoff losses include use of crop residues, application of animal manure in conjunction with crops, use of minimum tillage on slopes, and fertilization to stimulate early growth of crop. The total amount of NO3-N in the soil profile can be related directly to the rate of nitrogen application and frequency of the fertilized crop in the rotation. Methods for controlling the rate of pollution of underground water are given. Also given are methods of reducing nitrogen input into water. (Cameron-East Central Oklahoma State)

NATURE AND HISTORY OF THE NITRATE PROBLEM,
Missouri Univ., Columbia, Dept. of Veterniary Medicine and Surgery.
A. A. Case, G. Garner, G. E. Smith, and W. H. Pfander.
Science and Technology Guide, University of Missouri Extension Division, p 9800-9801. 1964.

Descriptors: *Nitrates, *Nitrites, *Farm wastes, *Pollutants, *Water pollution, *Forages, Corn belt, Water pollution sources, Poisons, *Water pollution effects.
Identifiers: Methomoglonemia, Fuming silos, Animal wastes.

Excessive nitrate content of forage plants and 'loaded' water supplies is being recognized in the corn belt states (Kansas, Iowa, and Missouri) as a serious problem. The major cause of these excessive nitrates seems to be animal wastes. Fuming silos are another source of nitrate poisoning. Fuming silos are grain storage silos which give off an often lethal gas during the filling and a week or so afterwards. This gas comes from forage that contains excessive amounts of nitrate or nitrite, but the amount doesn't have to be very high. Juice draining from fuming silos is also a dangerous toxic agent for anything exposed to it. Nitrate poisoning of human infants and of livestock is discussed. Symptoms are described. RUNOFF CONTROL SYSTEMS FOR CONCRETE DAIRY CATTLE YARDS,
Wisconsin Univ., Madison. Coll. of Agricultural and Life Sciences.
C. O. Cramer, T. J. Brevik, G. H. Tenpas, and D. A. Schlough.
Presented at the 67th Annual Meeting, American Society of Agricultural Engineers, Oklahoma State University, Stillwater, June 23-26, 1974; Paper No. 74-4016, 23 p, 11 fig, 6 tab, 7 ref.

Descriptors: *Runoff, *Control, *Cattle, *Dairy industry, *Waste storage, *Waste disposal, Effluents, Precipitation, Sampling, Chemical characteristics, *Agricultural runoff, Water pollution sources
Identifiers: *Paved yards.

Two sites were chosen for study of runoff control systems for paved dairy yards. One system, at the Holwis farms, was for 200 head of milking cows plus heifers in a cold free stall farm. The other system, at the UW Ashland Experimental farms, contained 32 cows in a stanchion barn with paved exercise yard. Both systems were very similar with the same principles of solids separation, liquid storage, and land application. Analyses were made on the detention pond effluent and the separated solids. The Holwis farm collected 45 and 49% of the rain on the paved and unpaved yards and roof areas for the two years of study with 2.7 and 1.7 million gallons of effluent being removed. The Ashland farm collected 84, 67, and 71% of the rain for eight months of study with 0.6 and 0.5 million gallons of effluent being removed during the two years. Metal screens proved to be better than porous rock-filled dams for solid separation. Analyses of the retention pond effluent showed considerable variation in content. The detention ponds in both systems were designed with insufficient capacity to allow effluent to be applied only when soil conditions were favorable. The runoff control systems described required considerable labor and management. (Russell-East Central Oklahoma State)

WATER QUALITY OF STORM RUNOFF FROM A TEXAS BEEF FEEDLOT,
Texas A and M Univ., College Station.
G. G. Wise, III.
MS Thesis, August, 1972, 166 p, 34 fig, 79 tab, 28 ref.

Descriptors: *Water quality, *Storm runoff, *Texas, *Feed lots, *Cattle, Sampling, Equipment, Chemical oxygen demand, Phosphorus, Nitrogen, Potassium, Sodium, Chloride, Slope, Waste treatment, Water pollution.

One of the major sources of pollution from high density beef feedlots is storm runoff. Efforts were made to determine the variation in chemical and physical properties of storm runoff from a beef feedlot area of Texas and to correlate the water quality variations with storm characteristics and hydrologic properties of the feedlot drainage area.

The average concentrations of water quality parameters in the feedlot runoff did not change as much with variations in rainfall intensities, runoff rates, and runoff volumes as indicated by similar runoff studies. The concentrations of COD, phosphorus, and Kjeldahl nitrogen in the runoff were directly related to the total soils concentration. The concentrations of filterable solids, potassium, sodium and chloride were greater when the contact time between the surface and the runoff was increased. The higher average concentrations of total solids, COD, phosphorus, and Kjeldahl nitrogen, and lower average concentrations of filerable solids, potassium, sodium, and chloride from one area were due to the greater slope causing an increased sediment load and decreasing the contact time between the runoff and the feedlot surface. (Russell-East Central Oklahoma State)

CONTROLLING SEDIMENT AND NUTRIENT LOSSES FROM AGRICULTURAL LANDS,
New York State Coll. of Agriculture and Life Sciences, Ithaca. Dept. of Agricultural Economics.
J. J. Jacobs.
Cornell Agricultural Economics Staff Paper No 72-20, September, 1972, 16 p, 2 fig, 4 tab, 20 ref.

Descriptors: *Sediment control, *Nutrients, *Agriculture, *Phosphorus, Farm wastes, Livestock, Water pollution sources, Runoff, Model studies, Costs.

Sources of potential pollutants from agricultural production are: sediment from erosion; plant nutrients; livestock manure; pesticides; waste from processing plants; and air pollution, primarily odors and dusts. Sediment and phosphorus were selected for intensive study because of the magnitude of sediment as a pollutant, the increased emphasis on phosphorus as a likely key nutrient in limiting growth of aquatic plant life, and the diffuse sources of such pollutants from agricultural runoff as compared to point sources. Surface runoff from agricultural cropland is the primary transport agent of sediment entering surface waters. Therefore, planning for the control of sediment requires knowledge of the relations between those factors that cause loss of soil and those that help reduce such losses on cropland. The methods allowed for controlling sediment and phosphorus losses are presented. The question of which control methods and at what level depends on the level of water quality desired, the unit cost coefficients of alternative methods, and the technical coefficients of the alternative methods. A summary of the cost coefficients is presented. Sediment and phosphorus coefficients were also estimated for each management system listed. (Cartmell-East Central Oklahoma State)
W76-01090

ABANDONED FEEDLOTS CAN POLLUTE MORE THAN ACTIVE ONES.
Crops and Soils Magazine, Vol 27, No 3, p 23, December, 1974.

Descriptors: *Feed lots, *Nitrogen, Cattle, Livestock, Water pollution sources, Nitrates.

Lloyd N. Mielke, U. S. Department of Agriculture and University of Nebraska soil scientist, has been conducting a study of the nitrate concentrations beneath feedlots. Under abandoned feedlots, he found an average concentration of 3.2 tons of nitrates per acre in the top 30 feet of the soil. Under active feedlots, he found only 0.8 tons per acre. The makeup of the surface of the feedlot is the reason for this difference. Active feedlots have an impenetrable seal on the surface that prevents air and water from getting through. The nitrogen under this seal is kept in a relatively immobile organic form. (Cameron-East Central Oklahoma State)
W76-01095

ZETA POTENTIAL STUDIES OF COLLOIDAL SUSPENSIONS FROM A BEEF CATTLE FEEDLOT SURFACE,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
J. C. Lorimor.
MS Thesis, 1969, 59 p, 12 fig, 12 tab, 29 ref.

Descriptors: *Zeta potential, *Feed lots, *Cattle, Runoff, Water pollution, Hydrogen ion concentration, Irrigation, Waste water treatment, Sampling, Temperature, Statistical models, Farm wastes.
Identifiers: *Colloidal suspensions, Quadratic equations, Alum.

Runoff from beef cattle feedlots is one source of potential water pollution. Two alternatives are available to prevent feedlot runoff from polluting streams: (1) the water can be spread on agricultural land as irrigation water. or (2) it can be treated before it is released to the streams. Zeta potentials on colloidal solids in feedlot water samples were investigated as one method of treatment control. Zeta potentials average -29.5 millivolts on untreated samples. The potentials varied with pH and solids concentrations according to theory. Particle zeta potentials were controlled by chemical treatments and high chemical dosages were required to reduce the zeta potentials to near the isoelectric point. Quadratic equations could be written to accurately define the relationships between zeta potentials, solids concentrations, and pH and between zeta potentials, chemical dosages, and solids concentrations. EVIDENCE FOR THE OCCURRENCE OF SPECIFIC IRON (III)-BINDING COMPOUNDS IN NEAR-SHORE MARINE ECOSYSTEMS,
Texas Univ., Port Aransas. Marine Science Inst.
M. Estep, J. E. Armstrong, and C. Van Baalen.
Applied Microbiology, Vol 30, No 2, p 186-188, August 1975, 1 tab, 10 ref.

Descriptors: *Heavy metals, *Iron, *Absorption, *Marine algae, *Marine plants, *Bioassay, Aquatic bacteria, Cultures, Ecosystems, Chromatography, Chalation, Biota, Algae.
Identifiers: *Blue-green algal mat, *Sea grass, *Siderachromes, *Secondary hydroxamic acids, *Arthrobacter JG-9, Iron binding compounds.

The siderochrome auxotroph JG-9 was used in a bioassay to determine the amount of secondary hydroxamic acids (specific iron chelators) present in aqueous extracts of near-shore marine samples. The samples included blue-green algae mats and sea grass, which gave strongly positive responses. The samples were homogenized or minced in distilled water and filtered. The filtrate was concentrated and applied to filter paper discs which were applied directly to seeded JG-9 plates. The places were incubated and growth measured by diameter of zone as compared to growth of cultures on plates with known Desferal (methane sulfonate of iron-free ferrioxamine B) standards. Results indicate significant amounts of iron-binding compounds present in blue-green algal and sea grass samples. The hydroxamate type of iron chelator present may be important in providing a form of iron in sea water readily utilized by the microalgae and marine higher plants. (Davis-Vanderbilt)
W76-01101

ROLE OF BACTERIA IN BIOACCUMULATION OF MERCURY IN THE OYSTER CRASSOSTREA VIRGINICA,
Maryland Univ., College Park. Dept. of Microbiology.
G. S. Sayler, J. D. Nelson, Jr., and R. R. Colwell.
Applied Microbiology, Vol 30, No 1, p 91-96, July 1975, 3 fig, 5 tab.

Descriptors: *Mercury, *Pseudomonas, *Oysters, *Food chains, *Tracers, *Heavy metals, *Chesapeake Bay, Absorption, Bacteria.
Identifiers: Gamma counting, Bioaccumulation.

The role of mercury-resistant bacteria in the uptake of mercury by oysters was investigated. Oysters were maintained in a closed system, sealed aquarium with stirred, aerated water containing 10 micrograms of 203 $HgCl_2$ per liter. Uptake of 203 Hg by oysters held under control conditions was compared with that of 203 Hg uptake by oysters under similar conditions except that mercury-accumulating and mercury-metabolizing aspects of Pseudomons isolated from Chesapeake Bay, were added to the experimental oysters. Mercury concentrations were determined by measuring tissue and fluid radioactivity in a spectrophotometer equipped with an an auto-gamma spectrometer. Mercury accumulation was significantly greater in oysters in the presence of the experimental bacteria. The concentration of mercury was greater in the gill and visceral tissue than other oyster tissues. (Davis-Vanderbilt)

FATE OF TRACE METALS IN LOS ANGELES COUNTY WASTEWATER DISCHARGE,
Massachusetts Inst. of Tech., Cambridge. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics; and Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
F. M. M. Morel, J. C. Westall, C. R. O'Melia, and J. J. Morgan.
Environmental Science and Technology, Vol 9, No 8, p 756-761, August, 1975. 4 fig, 3 tab, 14 ref.

Descriptors: *Heavy metals, *Trace elements. *Pollutants, *Pollutant identification, *Equilibrium, Chemical precipitation, Waste water disposal, Water pollution, Water quality, Sewage effluents, Analytical techniques, Model studies, Solubility.
Identifiers: *Los Angeles County, *Chemical speciation, *Sewage particulate, *Sewage dilution, *Equilibrium models, Ocean outfalls.

An equilibrium model is presented of trace metal movement from an ocean outfall. The chemical speciation of trace metals as they reach the ocean from the Los Angeles sewage system is discussed. A study of the oxidation and dilution of the sewage by seawater demonstrates that most metals tend to be solubilized upon disposal in the ocean and that unmeasurable increments in the natural metal concentrations should result in the farfield. It is hypothesized that the sewage particulate is not mobilized in the vicinity of the outfall and that the nearby sediments are a mixture of naturally occurring sediments and sewage particulate. About 0.5% of the sewage particulate (and its metal content) can be accounted for in the reduced area on the ocean floor around the county outfall system. The study points out important research needs in the area of analytical chemistry of wastewaters and in the area of physical transportation processes in coastal waters. (Davis-Vanderbilt)

PHOSPHORUS IN SURFACE RUNOFF FROM A DECIDUOUS FOREST,
Minnesota Univ., St. Paul. Dept. of Soil Science.
M. J. Singer, and R. H. Rust.
Journal of Environmental Quality, Vol 4, No 3, p 307-311, 1975. 4 fig, 2 tab, 26 ref.

Descriptors: *Phosphorus, *Rainfall-runoff relationships, *Eutrophication, *Surface runoff, *Deciduous forests, Minnesota, Snowmelt, Forest soils, Soil erosion.
Identifiers: Lake Minnetonka(Minn).

Phosphorus loss in surface runoff from a deciduous forest ecosystem was determined in Lake Minnetonka, Minnesota, watershed. Runoff was highest in March due to melting snowpack, in May due to continuous heavy rains, and in July due to intense short duration rains on dry soil. Runoff in other months was related to rainfall amount, intensity, and soil moisture. Most small storms did not precipitate runoff. Intense storms often exceeded the soil's infiltration rate, dislodged soil particles, with consequent runoff. The canopy reduced precipitation intensity and amounts reaching the soil surface. Forest litter had a large water holding capacity and rapid infiltration rate which protected soil mineral from direct rainfall impact and reduced runoff. Any melting snow in December-January saturated lower snow layers but did not create runoff. Spring runoff volume was determined by snowpack depth, water content, air temperature, and presence or absence of frozen soil surfaces. Yearly runoff volume and timing varied greatly. March runoff had more phosphorus but in other months phosphorus concentration was inversely related to runoff volume. Sediment phosphorus loss was linearly correlated with maximum precipitation. Care should be given in extrapolating the findings for the rate of phosphorus loss from the test plot to an entire forest. (Buchanan-Davidson--Wisconsin)

NITRATE, PHOSPHORUS, AND SULFATE IN SUBSURFACE DRAINAGE WATER,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
J. L. Baker, K. L. Campbell, H. P. Johnson, and J. J. Hanway.
Journal of Environmental Quality, Vol 4, No 3, p 406-412, 1975. 2 fig, 4 tab, 17 ref.

Descriptors: *Eutrophication, *Tile drainage, *Groundwater, *Nutrients, Nitrates, Nitrogen, Sulfates, Phosphorus, Phosphates, Subsurface drainage, Fertilization, Flow rates, Agriculture, Iowa.
Identifiers: Skunk River(Iowa).

To determine nutrient losses associated with subsurface drainage water and the effect fertilization rate has on these losses, measurements were made of flow, nitrate-nitrogen, phosphate-phosphorus, total phosphorus, and sulfate-sulfur in subsurface drainage water from tile-drained cropland in Iowa. Annual nutrient losses were variable; phosphorus, sulfate-sulfur, and nitrate-nitrogen losses ranged from 0 to 0.04, 0 to 32, and 0 to 93 kg/ha, respectively, and were dependent on amount of water lost. Because of low phosphorus concentrations, losses with subsurface drainage water were insignificant compared to losses associated with surface runoff. Sulfate-sulfur and nitrate-nitrogen concentrations appeared to be inversely related. Tile drainage water with consistently high nitrate-nitrogen relative to surface runoff was believed responsible for high nitrate-nitrogen contents sometimes found in rivers draining central Iowa. Nitrate from saturated and unsaturated soil indicated that water waves or pulses with different nitrate-nitrogen concentrations move through the soil causing variations in subsurface drainage water with time and flow rate. The large amounts of nitrate-nitrogen lost from some tile drains with modest fertilization and variations in tile drains make it impossible to ascribe nitrate-nitrogen loss to fertilizers alone. Nitrate-nitrogen loss represents an economic and energy waste as well as an environmental hazard. (Buchanan-Davidson--Wisconsin)

WATER POLLUTION FROM AGRICULTURE,
Kungliga Lantbrukshogskolan, Uppsala (Sweden).
N. Brink.
Journal Water Pollution Control Federation, Vol 47, No 4, p 789-795, 1975. 3 fig, 9 tab, 1 ref.

Descriptors: *Agricultural runoff, *Water pollution, Fertilizers, Farm wastes, Groundwater, Urine, Livestock, Nitrogen, Phosphorus, Nitrates, Nutrients, Water pollution sources, Europe, Feeds, Feed lots, Sludge, Silage.
Identifiers: Sweden.

Risks of surface and groundwater pollution in Sweden are increasing due to increased livestock production and use of commercial fertilizers in agriculture. Urine and silage juice are especially rich in organic contaminants. Wastewater from dwellings in usually treated in septic tanks before release into open water or infiltration into the ground. To prevent water pollution, manure and silage juice should be spread on arable land. The application of sewage sludge as a fertilizer should not exceed 150 tons/ha in wet form and be spread at widely spaced intervals. Urine, dungyard water, liquid manure, and silage juice may leak into surface and groundwater from animal stables. Commercial fertilizer use has increased thus climatic and soil factors are crop growth limiting. Nitrogen is mostly in the form of nitrates, with very small amounts of ammonia. Phosphorus is sometimes very high in groundwater. Chemical reduction probably a role in deeper layers, especially in clay soils. The nitrogen budget for a field at Nasbygard, Sweden is given; most of the input went to grain, some to air and water. Neither burning of straw nor excessive fertilizer is acceptable husbandry. (Buchanan-Davidson--Wisconsin)

PHOSPHORUS IN NEW YORK STATE RIVERS: SOURCES, SINKS, AND DETERGENTS,
State Univ. of New York at Binghamton. Dept. of Chemistry.
J. T. Haney.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 983, $4.50 in paper copy, $2.25 in microfiche. Report SS-306 (NSF-RA-G-73-032), August 1973. 58 p. 8 fig, 9 tab, 39 ref.

Descriptors: *Eutrophication, *Phosphorus, *Rivers, *Detergents, *Water pollution sources, *New York, Sinks, Input-output analysis, Runoff, Land use, Absorption, Watersheds(Basins), Sediments, Sewage effluents, Model studies, Land management.
Identifiers: Mass balances, Susquehanna River(NY), Genessee River watershed(NY), Allegheny River watershed(NY), Mohawk River watershed(NY).

Phosphorus levels in New York rivers considerably exceeded the phosphorus concentrations in lakes. Municipal wastewaters were especially important, but removal of phosphorus from detergents should substantially reduce phosphorus inputs. Mass balances (inputs versus outflow for a one year period), using phosphorus runoff factors, according to land use and per capita sewage for phosphorus in seven New York watersheds, including basins of the Susquehanna, Genesee, Allegheny, and Mohawk Rivers, showed qualitative agreement. Data on sewage discharges, sediment characteristics, and river phosphorus uptake for the Susquehanna River were collected and a model of phosphorus load versus river miles constructed; this agreed with measured phosphorus loads. Phosphorus reduction in municipal wastewaters due to a ban on phosphate detergents and better land management practices will help. An integrated approach to waste disposal is needed so that nutrient removal from effluents can be coordinated with river models and biological impacts to determine the size and location of discharges in order to minimize their effects. (Buchanan-Davidson--Wisconsin)

BENTHIC FAUNA AND ZOOPLANKTON IN SOME POLLUTED SWEDISH ESTUARIES,
Uppsala Univ. (Sweden). Inst. of Zoology.
I. Olsson, R. Rosenberg, and E. Olundh.
Ambio, Vol 2, No 5, p 158-163. 1973. Illus.
Identifiers: *Benthic fauna, Corer, Diversity, *Estuaries, Gradients, Outflows, Plankton, Rivers, *Salinity, *Zooplankton, *Sweden.

Meiofauna (0.1-1 mm), macrofauna (>1 mm) and zooplankton (> 0.16 mm) in 4 Swedish estuaries were sampled with piston corer, Smith-McIntyre grab and Nansen net, respectively. The faunal communities were evaluated by indicies. The diversity of the meiofauna reflected differences in pollution rather than differences in salinity. A combined effect of pollution and reduced salinity gave a lower macrofaunal diversity outside river mouths. The meio- and macrofaunal composition was often similar between the various estuaries than within individual estuaries, reflecting the steep gradient caused by river outflow with effluents. The zooplankton fauna was almost uniform in all the estuaries.--Copyright 1974, Biological Abstracts, Inc.

INDUSTRY WASTE STUDY. THE HAWAII SUGAR INDUSTRY WASTE STUDY.
Environmental Protection Agency, San Francisco, Calif. Region IX.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-238 931, $5.50 in paper copy, $2.25 in microfiche. June, 1971. 115 p, 34 fig, 18 ref, 9 tab.

Descriptors: *Hawaii, *Industrial wastes, *Sugarcane, *Water pollution, Water pollution sources, Wastes, Surface runoff, Water quality control, Bacteria, Coliforms, Suspended solids, Chemical oxygen demand, Nitrogen, Phosphorus,

Waste water, Water quality standards, Irrigation water, Storm runoff, Nutrients, Water pollution control, Sea water.
Identifiers: *Sugar industry, Sugar refining, Bagasse.

Wastes generated by agricultural activities in Hawaii, particularly sugar mill operations, are creating significant water pollution problems which threaten the tourist industry. A preliminary industrial process survey was made of all 26 sugar mills located in the State of Hawaii, and detailed in-plant surveys were carried out in 3 mills. The results show that sugar mill waste water (mill processing water and cane-wash water) as well as irrigation water and storm water runoff from fields contain large amounts of oxygen-consuming materials, suspended solids, nutrients, and bacteria. Average sugar production at each of the 3 mills was 210 tons/day and effluent flow rates were between 5 and 10 million gal/day. The mill water contained, per ton of raw sugar produced, an average of 1,850 lb of suspended solids, 1 750 lb of settleable solids, 650 lb of oxygen-consuming material (as measured by COD), 12 lb of total nitrogen, and 5 lb of phosphorus. The bacterial densities found in the wash waters average 4,850,000 total coliform organisms and 130,000 fecal coliform organisms/100 ml. At least 8 of the mills on the island of Hawaii and 2 mills on the island of Kauai discharge cane trash and/or bagasse to the ocean. To enhance water quality to the level described in the Water Quality Standards of the State of Hawaii in those areas influenced by discharges from sugar plantations, the following changes in operating conditions should be made: the discharge of trash and bagasse to coastal waters should be discontinued; all discharges should be treated or controlled; and efforts should be made to control excess irrigation and storm runoff waters. DOMESTIC SOURCES OF STREAM PHOSPHATES IN URBAN STREAMS,
Windsor Univ., (Ontario). Dept. of Geography.
P. D. La Valle.
Water Research, Vol 9, No 10, p 913-915, October 1975. 3 tab, 12 ref.

Descriptors: *Regression analysis, *Phosphates, *Water pollution sources, Fertilizers, Detergents, Domestic wastes, Water pollution, Urbanization, Sampling, Analysis, Chemical analysis, Water analysis, Rainfall, Septic tanks, Sewers, Census, On-site investigations, On-site data collections.
Identifiers: *Windsor(Canada), *Urban streams, Residential areas.

To assess the relationships between stream orthophosphate, stream polyphosphate concentrations, and possible domestic sources, a random sample of 24 drainage basins dominated by residential land use activities was studied. Stream orthophosphate and polyphosphate data were then correlated with the following variables: (1) mean garden fertilizer use (kg/yr), (2) mean phosphate detergent used (kg/month), (3) per cent watershed households connected to city sewers, (4) precipitation phosphate concentration. When a multiple regression analysis was run on the phosphate data, 76% of the variation in stream orthophosphate concentrations was accounted for by the percentage of watershed households connected to city sewers parameter, while garden fertilizer use and precipitation phosphate content accounted for 4 to 2% of the variation respectively. In a similar analysis of stream polyphosphate concentrations, a combination of detergent use and the percentage of watershed households connected to city sewers accounted for 48% of the total variation of stream polyphosphate concentrations. (Lardner-ISWS)

ASSESSING UNRECORDED ORGANIC POLLUTION FROM AGRICULTURAL, URBAN, AND WOODED LANDS,
Rutgers--The State Univ., New Brunswick, N.J.
S. L. Yu, W. Whipple, Jr., and J. V. Hunter.
Water Research, Vol 9, No 10, p 849-852, October 1975. 5 fig, 4 tab, 9 ref.

Descriptors: *Biochemical oxygen demand, *Water pollution, *Organic wastes, *Water pollution sources, *Regression analysis, *New Jersey, Streamflow, Frequency analysis, Watersheds(Basins), Runoff, Sampling, Analysis.
Identifiers: Wooded areas, Agricultural areas, Urban areas.

An investigation was conducted of the organic pollution for seven small New Jersey watersheds representing agricultural, urban, and wooded lands. The 5-day biochemical oxygen demand (BOD) was used as a main index of organic pollution. Data obtained for 2.5 yr period indicated background BOD concentrations averaging from 0.5 to 2.0 mg/1 in all streams, except that a value of 9.0 mg/1 was obtained for a residential-commercial-industrial area. During or after rainstorms, the BOD loadings, in pounds per day per unit area, usually became more than ten times the background amount for all streams. No significant correlation was found between BOD concentration and flow rate, but good correlations were obtained between BOD loadings and flows. The seasonal pattern of BOD loading distribution was examined. The frequency distribution of BOD concentrations and loadings were also obtained. (Lardner-ISWS)

LIMITATIONS OF THE ELECTRICAL RESISTIVITY METHOD IN LANDFILL INVESTIGATIONS,
G. Klefstad, L. V. A. Sendlein, and R. C. Palmquist.
Ground Water, Vol 13, No 5, p 418-427, September-October 1975. 10 fig, 1 tab, 23 ref.

Descriptors: *Resistivity, *Landfills, *Water pollution, *Leachate, *Geologic investigations, *Iowa, *Pollutant identification, Physical properties, Electrical resistance, Solid wastes, Pollutants, On-site investigations, On-site data collections, Exploration, Water quality.
Identifiers: *Groundwater contamination, *Leachate detection, *Electrical resistivity method, Isoresistivity maps, Isoconcentration maps.

The electrical resistivity method was used to delineate shallow zones of groundwater contamination resulting from solid waste disposal sites. Application of this method to sites located in alluvial deposits in Iowa revealed that the degree of success of the method was directly related to the degree of contamination. A detailed investigation of the interrelationship between electrical resistivity, material variation, and water quality was conducted in the alluvial deposits of the Skunk River at Ames, Iowa. The lateral variation of materials at this site resulted in a large, natural scatter in the resistivity response. The decrease in resistivity due to contamination was not greater than this natural scatter and thus could not be detected. These results suggested a relationship between the scatter levels at any site and the minimum degree of contamination necessary to be detected. The minimum level of contamination which can be detected over the natural scatter was called the threshold value. The threshold value must be known before the resistivity method can be applied with confidence. (Sanderson-ISWS)

Available from the National Technical Information Service, Springfield, Va 22161 as N75-10571, $5.00 in paper copy, $2.25 in microfiche. Chesapeake Research Consortium Publication No 6, June 1974. 89 p.

Descriptors: *Remote sensing, *Chesapeake Bay, *Bays, *Estuaries, Nutrients, Thermal pollution, Industrial wastes, Pesticides, Industrial plants, Erosion, Wetlands, Land use, Meteorology, Solid wastes, Satellites(Artificial), Radar.
Identifiers: Data collection platforms.

Twelve environmental problem areas concerning the Chesapeake Bay region were reviewed along with ongoing remote sensing programs pertaining to these problems. Forty-three recommendations were presented to help fill lacunae in present research and to utilize the remote capabilities of NASA to their fullest. A list of interested organizations and individuals was presented for each category. Among the recommendations were the development of technologies to monitor dissolved nutrients in Bay waters, the initiation of a census of the disappearing rooted aquatic plants in the littoral zones, and the mapping of natural building constraints in the growth regions of the states of Maryland and Virginia. ANIMAL WASTES AND FERTILIZERS AS POTENTIAL SOURCES OF NITRATE POLLUTION OF WATER,
Agricultural Research Service, Fort Collins, Colo.
F. G. Viets, Jr.
In: Effects of Agricultural Production on Nitrates in Food and Water with Particular Reference to Isotope Studies, Vienna, International Atomic Energy Agency, p 63-76, 1974. 1 tab, 32 ref.

Descriptors: *Farm wastes, *Water pollution, *Nitrates, *Fertilizers, Hydrology, Nitrification, Infiltration, Eutrophication, Agricultural runoff, Ammonia, Volitalization.
Identifiers: Isotopic nitrogen.

An updating and supplementing of the U.S. Department of Agricultural Handbook 413, 'Factors Affecting the Accumulation of Nitrate in Soil, Water, and Plants' (Viets and Hageman, 1971) are provided. A change from vegetable protein to animal protein in the human diet has resulted in the increased use of nitrogen fertilizer in the developed countries for the last 30 years. Stocking rate and the continuity of use of the feed-yard or holding area appear to be the factors upon which nitrate percolation to aquifers depend. Because of inhibited nitrification and infiltration, modern high-density cattle feed-yards have low nitrate flux. Volatilization of ammonia and its absorption by surface water may contribute to eutrophication and nitrate accumulation. Nitrate leakage occurs under highly productive cultivated land regardless of the nitrogen source. Fertilization management must hold this leakage to a tolerable concentration in relation to hydrology and use of underground water in the area. There is a need for better understanding of land productivity, nitrate leakage, and hydrology. Assistance in solving these problems may be obtained from isotopic nitrogen. (Kehl-East Central Oklahoma State)

THE NITROGEN STATUS BENEATH BEEF CATTLE FEEDLOTS IN EASTERN NEBRASKA,
Department of Agriculture Lincoln, Nebr.
J. R. Ellis, L. N. Mielke, and G. E. Schuman.
Soil Science Society Proceedings of America, Vol 39, No 1, p 107-111, January-February, 1975. 4 fig, 2 tab, 19 ref.

Descriptors: *Farm wastes, *Feed lots, *Nitrogen, *Soil profile, *Nebraska, Cattle, Soil contamination, Groundwater, Water pollution sources, *Path of pollutants.

The majority of the beef consumed in the United States comes from cattle fed in large, open, soil-surfaced feedlots in the Plains States and the Midwest. Feedlots are point sources of nitrogen since they provide intensive land use. The effects of beef-feedlot management systems on N accumulation in the soil profile and ground water were examined. Fifteen sites were selected in eastern Nebraska. Core samples were taken from feedlots, cropland-cattle-use areas and from cropland adjacent to feedlots to evaluate the effects of different management practices on the movement and accumulation of nitrogen in the soil profile. The soil texture of the feedlots sampled ranged from clay to coarse sand with the age of the feedlots ranging from a few weeks to more than 50 years. The sites examined were ranked according to decreasing average NO3 -N in the core as follows: abandoned feedlot, feedlot-cropland, upland feedlot, corn (Zea mays L) river-valley feedlot, profiles under feedlot mounds, alfalfa (Medicago sativa L) grassland. Feedlot management is an important consideration in the accumulation of NO3 in the soil profile. (Kehl-East Central Oklahoma State)

LOCATING A NEW FEEDLOT,
Nebraska Univ., Lincoln.
E. A. Olson.
Cooperative Extension Service Report GPE-5/01, University of Nebraska, Lincoln, n.d. 4 p, 5 fig.

Descriptors: *Feed lots, *Locating, *Farm wastes, *Water pollution, Livestock, Regulation, Zoning, Topography, Water supply, Transportation, Marketing.

The selection of a site for a livestock feedlot directly affects the success of the feedlot. Factors to consider in choosing a feedlot location include: environmental considerations, streams, topography, water supply, land area, towns and zoning laws. Other items include a source of livestock and feed, transportation (roads) and marketing facilities. Finally the operator must determine the size to build with provision for expansion. DISPOSAL OF FARM ANIMAL WASTES THROUGH THE SOIL,
Oregon State Univ., Corvallis.
M. G. Cropsey, and V. Van Volk.
Agricultural Engineering Annual Report of Research 1971-72, Agricultural Experiment Station, Oregon State University, Corvallis, 1972, 24 p. 1 fig, 14 tab.

Descriptors: *Waste disposal, *Cattle, *Dairy industry, *Irrigation, Slurries, Chemical properties, Water quality, Water pollution sources.
Identifiers: *Land disposal, *Waste water quality.

Disposal of livestock manure through an irrigation pumping system has proven economically successful, but some questions still need to be answered. The objective of this study was to determine the effect of large and frequent applications of dairy cow wastes on the soil. Another objective was to determine the quality of waste water in the soil and in the drainage water from such soil sites. The Oregon State University Dairy Farm was used for the study. It was determined that dairy manure slurry should not be applied the first year or two to a soil plot that has recently been installed with drain tile. This is advised because the slurry will short circuit through the freshly dug soil to the drain tile. When compared with the effluent applied there was a considerable reduction in TS, BOD and all forms of phosphorus and nitrogen in the dry wells and the drain tile. A considerable portion of both the liquids and solids was retained either in the soil or on the surface. The wind has considerable influence over the distribution of the manure water slurry. Recommendations for further investigation and some advice on application are given. (Kehl-East Central Oklahoma State)

TRANSFORMATIONS OF SWINE WASTEWATER IN LABORATORY SOIL PROFILES,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
L. F. McEver, F. J. Humenik, M. R. Overcash, and R. W. Skaggs.
Presented at 1974 Annual Meeting, American Society of Agricultural Engineers, Oklahoma State University, Stillwater, June 23-26, 1974, Paper No 74-2016, American Society of Agricultural Engineers, St. Joseph, Michigan. 19 p, 8 fig, 5 tab, 9 ref.

Descriptors: *Soil profiles, *Laboratory tests, Percolation, Nitrogen, Nitrates, Chemical oxygen demand, Water table, Liquid wastes, Hogs, Path of pollutants, *Waste water(Pollution).
Identifiers: *Loading rates.

The major objective was to investigate the transformations of swine waste lagoon effluent in packed and undistrubed Wagram soil columns with a shallow water table (36 inches). 70 percent of the wastewater nitrogen was converted to nitrate within the rooting zone (upper six inches) for loading rates of one and two inches per week with COD values ranging from 199 to 650 mg/l. While the organic materials moved through the soil with the soil water, a reduction in concentration with increased depth was observed. The organic portion of the swine wastewater was essentially stabilized after one week of storage in the upper soil regions. Almost complete removal (greater than 90 percent) of COD and TOC was recorded for flow through the entire packed and undisturbed soil columns. Mass balances showed no losses in total nitrogen as the wastewater percolated through the soil columns. The low COD to nitrogen ratio of the pretreated wastewater and the preferential removal of organics with soil depth restricted the possibility of induced percolation of carbonaceous substrate to the water table for complete denitrification without supplemental organic addition. (Cartmell-East Central Oklahoma State)

A SIMPLE DIFFUSION MODEL OF THE MEAN FIELD DISTRIBUTION OF SOLUBLE MATERIALS IN THE GREAT LAKES,
Canada Centre for Inland Waters, Burlington, (Ontario).
F. M. Boyce, and P. F. Hamblin.
Limnology and Oceanography, Vol 20, No 4, p 511-517, July 1975. 3 fig, 1 tab, 6 ref.

Descriptors: *Diffusion, *Mathematical models, *Lake Erie, *Mixing, Great Lakes, Tracers, Flow, Advection, Chlorides, Distribution patterns, Pollutants, Water pollution, Path of pollutants, Wastes.
Identifiers: *Chloride distribution, Concentrations, Transport.

In cases where the time scale of interest is long compared with the time scales of the principle energy-bearing components of the water motions, the movement of a soluble contaminant may be represented by a simple diffusion equation with a constant effective horizontal diffusion coefficient. A simple steady state model of the concentration field in a lake for a soluble contaminant introduced on the shore was developed and was applied to the distribution of chloride ion in the central basin of Lake Erie, for which appropriate experimental data were available. A horizontal diffusion coefficient, appropriate for basin-wide diffusion phenomena in the Great Lakes and for long-time scales, was estimated from experimental data. (Adams-ISWS)

Available from the National Technical Information Service, Springfield, Va 22161 as PB-229 797, $7.50 in paper copy, $2.25 in microfiche. Technical Report 33, March 1972. 174 p, 70 fig, 1 tab, 10 ref, append.

Descriptors: *Model studies, *Water quality, *Estuaries, *Potomac River, Mathematical models, Dye releases, Path of pollutants, Effluents, Tidal waters, Tidal effects, Dispersion, Advection.
Identifiers: *Anacostia River.

Mathematical models are becoming an increasingly important 'tool' for predicting, under a variety of conditions, water quality behavior in an estuary. The report presented recent Annapolis Field Office studies on use of models in the Potomac estuary, specifically, the Thomann Model (time-dependent version) and the FWQA Dynamic Estuary Model. Numerous computer runs were made with both models in an attempt to make a reasonably accurate simulation of dye profiles observed in the Potomac estuary following a 13-day continuous release during November 1969 and of observed dye profiles in the Anacostia River following a 7-day continuous release during April 1970. In addition to model verification, consideration was given to: (1) a comparison of modeling approaches, (2) the limitations of each model, (3) input data requirements, and (4) a detailed sensitivity analysis to determine which input parameters had the greatest effect on model output. While mathematical models have been developed for the entire Potomac estuary, most studies in the report pertained to the 40-mile reach of the upper estuary extending from Key Bridge to Sandy Point. (Sims-ISWS)

WATER QUALITY BASELINE ASSESSMENT FOR CLEVELAND AREA - LAKE ERIE, VOLUME I - SYNTHESIS,
Cleaveland Dept. of Public Utilities, Ohio. Div. of Utilities Engineering.
A. B. Garlauskas.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 353, $6.75 in paper copy, $2.25 in microfiche. Report EPA-905/9-74-005, May 30, 1974. 158 p, 33 fig, 22 tab, 345 ref. EPA G00517.

Descriptors: *Water quality, *Lake Erie, *Baseline studies, Streams, Rivers, Lakes, Fish, Water pollution, Pollution abatement, Pollutant identification, Path of pollutants, Industrial wastes, Cities, Urban runoff, Urban drainage, Pollutants, Water pollution sources, Surveys, Water chemistry, Benthos, Investigations, Sampling, Analysis, Thermal pollution, Model studies.
Identifiers: *Cleaveland(Ohio).

The results of the first phase of a three-phase program in environmental impact assessment, planning, and evaluation in urban water pollution abatement for the Cleveland metropolitan area were presented. The first phase investigated the water quality of near shore waters of Lake Erie in the Cleveland area and of the streams in the same area to establish a baseline to measure the prograss and restorative value of water pollution abatement programs. Seven major investigations were performed dealing with fish population, phytoplankton, zooplankton and benthic organisms, benthic sediment chemistry, water chemistry, cation reactions with suspended river sediments, and hydrodynamic modeling of river and thermal discharge flow into Lake Erie. The field investigations were conducted from September 1971 through December 1972. The area of investigation included lake waters from the mouth of Chagrin River along the shore to the mouth of the Rocky River, 35.5 kilometers. The area included the Cleveland Harbor and lower 20 kilometers of the Cuyahoga River. The study established a rough water quality baseline demonstrating areas of water quality degradation, possible restoration avenues, and need for future research. (Sims-ISWS)

5C. Effects Of Pollution

THE PRAIRIE PLAN,
Metropolitan Sanitary District of Greater Chicago, Ill.
F. L. Kudrna.
Journal of the Urban Planning and Development Division, American Society of Civil Engineers, Vol 99, No UP2, p 205-215, September 1973. 14 fig, 1 tab.

Descriptors: *Water reuse, *Environmental effects, *Sewage disposal, *Sludge disposal, *Sludge, *Agriculture, Waste water(Pollution), Reclamation, Planning, Watersheds(Basins).
Identifiers: *Urban planning, *Chicago, Urban development.

The Prairie Plan is a conceptual mechanism to recycle urban wastes safely into the natural environment. It assumes that to provide an acceptable solution, the following four requirements must be met: (1) the solution to the problem must be environmentally safe and not transfer the problem to another form of pollution; (2) the solution must be long-term and provide consistently reliable methods of operation; (3) the system must be economically competitive with other alternatives; and (4) the system must maximize multi-use aspects and be both publicly and politically acceptable. The Prairie Plan uses the natural watershed as a planning unit. The Metropolitan Sanitary District of Greater Chicago is implementing the Prairie Plan to recycle wastewater solids over at a 10,500-acre site in Fulton County, Illinois. The multi-use benefits od the Prairie Plan include land reclamation, agriculture, recreation, conservation, wildlife preservation, reforestation, and natural science education. (Bell-Cornell)

SOIL POLLUTANTS AND THEIR EFFECTS ON CLEAN WATER,
Minnesota Univ., St. Paul. Dept. of Soil Science.
W. P. Martin.
In: Proceedings of Conference on Farm Animal Wastes, Nitrates and Phosphates, in Rural Wisconsin Ecosystems, Madison, Green Bay, and Eau Claire, Wisconsin, February 1-5, 1971, p 125-133.

Descriptors: *Pollutants, *Water pollution, Farm wastes, Soil erosion, Pesticides, Fertilizers, Nutrients, *Soil contamination, Water pollution sources.

Municipal, industrial and agricultural wastes are major causes of pollution and all three must eventually be moderated if the purity of our lakes and rivers is to be restored or maintained. Especially troublesome are agricultural sources: animal wastes, eroded soil, fertilizers, and pesticides. The disposal of organic wastes from farm animals and from other sources related to the farm enterprise has become a major management problem. If land disposal of wastes is to be used, soil type, topography, and land avialability should be carefully considered when locating feedlots and processing operations. Terracing, minimum tillage, and land covers are means of combating soil erosion. Phosphatic fertilizers should be incorporated into the soil, if possible, in order to prevent it from being carried by runoff to surface waters. Measures should be taken to prevent nitrogen in fertilizers and organic wastes from entering surface and groundwater supplies. Pesticides must be realistically evaluated. It is likely that these potentially harmful compounds have benefits that far outweigh their detrimental effects. (Cameron-East Central Oklahoma State)

CONGENITAL ABNORMALITIES IN METHYLMERCURY POISONING,
New Jersey School of Medicine, Newark. Dept. of Anatomy.
S. H. Gilani.
Environmental Research, Vol 9, p 128-134, 1975. 5 fig, 3 tab, 15 ref.

Descriptors: *Heavy metals, *Mercury, *Pollutants, *Toxicity, *Embryonic growth stage, Deformation, Poisons, Environmental effects, Animal pathology, Incubation.
Identifiers: *Congenital abnormalities, *Chicken embryos, *Methylmercuric chloride, *Teratogenic, *Embryolethal, Malformation, Embryogenesis.

A study is described of the malformation of chicken embryos due to methylmercury poisoning. Methylmercuric chloride was dissolved in sodium bicarbonate (0.2%) and administered to chick embryos at doses ranging from 0.0009 to 0.010 mg per egg. Injections were made into two groups of 420 eggs. Group A received injections on the second day of incubation, while group B received injections on the third day. On the seventh day of incubation, the embryos were examined, treated and stored. Results show that methylmercuric chloride was both teratogenic and embryolethal. Percent survival in group B was higher than group A, but the incidence of gross abnormalities was the same for both groups. Beak defects, exencephaly, shortened and twisted neck, reduced body size, microphthalmia, everted viscera, and hemorrhage all over the body were the major malformations observed. (Davis-Vanderbilt)

IMPACT OF NITRATE FERTILIZER RESTRICTIONS ON SALT RIVER PROJECT AND ROOSEVELT WATER CONSERVATION DISTRICT GROWERS,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
D. F. Schoneman.
Master of Science Thesis, 1974. 130 p, 5 fig, 40 tab, 41 ref.

Descriptors: *Fertilizers, *Crop production, *Arizona, *Nitrates, *Economic impact, Field crops, Water pollution sources, Soil erosion, Soil management, Adoption of practices, Agricultural chemicals, Agriculture, Nitrogen, Farm prices, Regulations.
Identifiers: *Salt River Project District(Ariz), *Roosevelt Water Conservation District(Ariz).

Utilizing a procedure incorporating production functions and a linear programming formulation, the impact of government efforts to control farm pollution by restricting the use of nitrate fertilizers was studied for its effect on growers in the Salt River and Roosevelt Water Conservation areas. Enforcement of strict fertilizer restrictions could reduce the growers net revenue, but restrictions set at recommended agronomic levels could effect increased efficiency by some growers. Limitations of this research are dicussed. (McLachlan-Arizona)

PRELIMINARY INVESTIGATIONS ON MUTUAL GROWTH RELATIONS OF THE POPULATIONS OF THE BLUE-GREEN ALGA MICROCYSTIS AERUGINOSA AND GREEN ALGAE MONORAPHIDIUM MINUTUM AND SCENEDESMUS ABUNDANS IN BICULTURES,
Instytut Przyrodniczych Podstaw, Lublin (Poland). Produkeji Roslinnej RA.
A. Krzywicka, and D. Krupa.
Acta Hydrobiologica, Vol 17, No 1, p 81-88, 1975. 2 fig, 1 tab, 19 ref.

Descriptors: *Symbiosis, *Reproduction, *Cyanophyta, *Chlorophyta, Cultures, Inhibition.
Identifiers: *Microcystic aeruginosa, *Scenedesmus abundans, *Monoraphidium minutum.

Bicultures of the blue-grass alga Microcystis aeruginosa with common species of green algae were grown under laboratory conditions to determine if there was a relationship between growth of the populations of these two species. During a 16 day biculture, cell numbers of Monoraphidium minutum and Scenedesmus abundans increased much faster than Microcystis aeruginosa. Independent of initial cell numbers of the individual species, proportions changed toward the end of culture in favor of green algae. When the initial proportion of blue-green and green algae was 1:1, the final proportion was 1 Microcystis to 30 Monoraphidium or 1 Microcystis to 22 Scenedesmus. A monoculture control of Microcystis aeruginosa had a larger cell number after 16 days culture than mixed cultures, and there were more reduplications of cell numbers. In bicultures with an initial majority of blue-green algae, the number of reduplications of cell number of both blue-green and green algae was lower than in cultures with other initial proportions, indicating that the generation period of the two species was prolonged. These results suggest that Microcystis blooms in lakes can take place only under conditions unfavorable for green algae. (Buchanan-Davidson--Wisconsin)

SEASONAL VARIATION OF MANGANESE IN A EUTROPHIC LAKE,
Skidmore Coll., Saratoga Springs, N.Y. Dept. of Biology.
H. H. Howard, and S. W. Chisholm.
American Midland Naturalist, Vol 93, No 1, p 188-197, 1975. 2 fig, 29 ref.

Descriptors: *Fluctuations, *Seasonal, *Manganese, Eutrophication, Lakes, New York, Stratification, Turnovers, Surface waters, Hypolimnion, Cycling nutrients, Anaerobic conditions.
Identifiers: *Round Lake(NY).

To understand seasonal manganese availability in a eutrophic lake and determine the influence of stratification and overturn on manganese, Mn concentrations were measured for 15 months in Round Lake, New York. Manganese concentration was 0.014-0.108 ppm in surface waters and 0.042-2.49 ppm in bottom waters. The concentration pattern varied as the lake alternated between overturn and stagnation. Under anaerobic conditions, essentially 100% of manganese passed through a 0.45 micron membrane filter. Winter and summer maximum concentrations were about the same at 1-4 m, but at 5-7 m summer maxima were 2-6 times higher than winter maxima. Epilimnion values decreased 73% immediately after autumn overturn to low values before ice cover. After stratification, manganese concentrations rose in bottom waters until overturn began. Accumulation at 7 m was rapid at first, then slowed. Accumulation in bottom waters was 0.009-0.026 mg/l/day. Assuming values at 1-2 m during summer to be minimal, overturn raised the concentrations for about 6 weeks in spring-summer and 2-3 months in autumn. Blue-green algae were always dominant. Total manganese varied from 174 kg after spring overturn to 2553 kg at end of summer stratification. Possible effects of manganese cycling on organisms and other nutrients are discussed. (Buchanan-Davidson--Wisconsin)

WATER QUALITY AND PHYTOPLANKTON PRODUCTIVITY OF SUMMERSVILLE RESERVOIR,
West Virginia Univ., Morgantown. Dept. of Biology
J. E. Fraser.
Proceedings West Virginia Academy of Science, Vol 8, p 8-16, 1974. 4 fig, 1 tab, 17 ref.

Descriptors: *Water quality, *Phytoplankton, *Primary productivity, *West Virginia, *Reservoirs, Thermal stratification, Epilimnion, Hypolimnion, Oxygen, Hydrogen ion concentration, Light penetration, Conductivity, Alkalinity, Photosynthesis, Carbon, Limiting factors, Aerobic conditions, Mesotrophy.
Identifiers: *Summersville Reservoir(W Va).

Limnological studies of Summersville Reservoir, West Virginia, were conducted from September 1971-October 1972. This seven-year-old reservoir was thermally stratified in summer; the epilimnion was approximately 6 m deep. There was no distinct isothermal hypolimnion. Oxygen was not depleted. The oxygen curve was orthograde in summer but became a clinograde curve after the maximum production peak. Light transmission (1% level) varied from 4-12 m. Conductivity was low. Hydrogen ion concentration ranged from 6.3-7.3, with highest values at the surface. Mean alkalinity was 3.12 mg/l as calcium carbonate. Total inorganic carbon was 1.80-4.92 mg C/l. Carbon fixation ranged from 0.0-842.91 mg C/cu m/day. Aereal production ranged from 3.48-3176.16 mg C/sq m/day; total annual areal production was 170.11 g C/sq m. There was a small spring phytoplankton production peak with maximum production of 217.60, and a summer peak with 842.91 mg C/cu m/day. On high productivity days, the vertical assimilation curve had an epilimnic assimilation maximum followed by a rapid decline. On sunny summer days with high transparency, the curve had both epilimnic and metalimnic maxima. Algal growth was more light-limited than nutrient limited. The lake is considered mesotrophic. AN EVALUATION OF ARTIFICIAL DESTRATIFICATION FOR CONTROL OF ALGAL BLOOMS,
Tetra Tech, Inc., Lafayette, Calif.
M. W. Lorenzen, and R. Mitchell.
Journal American Water Works Association, Vol 67, No 7, p 373-376, 1975. 7 fig, 1 tab, 12 ref.

Descriptors: *Destratification, *Probability, *Water quality control, *Mathematical models, *Algal control, Limiting factors, Light penetration, New Hampshire, Forecasting, Mathematical models.
Identifiers: Kezar Lake(NH).

To evaluate the suitability of a lake for artificial destratification for control of algal blooms, a diagram plotting peak algal biomass as a function of mixed depth for both nutrient and light limitations is needed. Studies of eutrophic Kezar Lake, New Hampshire, which was destratified in 1968, 1969, and 1970 with compressed air, were used to evaluate a model developed to predict effects of artificial destratification on algal production in impoundments. The model considered both nutrient depletion and light limitation as potential biomass limiting factors. These were combined to determine the upper limit to biomass production as a function of mixed depth. Nutrient limitation was the capacity to produce biomass before some essential nutrients were exhausted. Biomass limitation by available light was determined by evaluating the balance between photosynthesis and respiration in the water column. Artificial destratification did not increase algal biomass and total peak biomass was lower during continuous aeration. Because total biomass was reduced when the mixed layer depth was increased, algal cell concentration was reduced. Apparently the algae were unable to use available nutrients when artificially mixed. Results suggested that available light limited peak biomass. (Buchanan-Davidson--Wisconsin)

USE OF WATERHYACINTHS TO REMOVE NITROGEN AND PHOSPHORUS FROM EUTROPHIC WATERS,
Louisiana Agricultural Experiment Station, Baton Rouge.
E. P. Dunigan, R. A. Phelan, and Z. H. Shamsuddin.
Hyacinth Control Journal, Vol 13, June, p 59-61, 1975. 2 fig, 1 tab, 12 ref.

Descriptors: *Nutrient removal, *Water hyacinth, Aquatic plants, Nitrogen compounds, Phosphorus compounds, Ponds, On-site tests, Louisiana, Laboratory tests.

Water hyacinths were grown in the greenhouse in six liters of water containing either 0.3 g (50 ppm), 0.6 g (100 ppm), or 1.5 g (250 ppm) nitrogen or phosphorus as ammonium chloride-nitrogen, potassium nitrate-nitrogen, or potassium hydrogen phosphate-phosphorus. Ammonium-nitrogen (50 or 100 ppm) was completely gone in 15 and 21 days; nitrate-nitrogen (50 ppm) was removed in 23 days. Large losses of ammonium-nitrogen and nitrate-nitrogen also occurred within 35 days at the higher concentrations. About 80, 150, and 210 mg of phosphate-phophorus were removed from water containing 50, 100, and 250 ppm phosphorus. At the highest level, phosphorus was apparently released to the water during the first three weeks of the experiment. Field studies were conducted at two farm ponds near Baton Rouge and St. Gabriel, Louisiana, using bottomless barrels set in pond sediment. The tests indicated that water hyacinths increased the rate at which ammonium-nitrogen was lost from pond waters. They were completely ineffective in reducing nitrate-nitrogen and of minimal value in phosphate-phosphorus losses. Observed nitrate and phosphate concentrations decreases were due to denitrification, adsorption, and other mechanisms. (Buchanan-Davidson--Wisconsin)

LIGHT, NITROGEN, AND PHOSPHORUS LIMITATION OF EDAPHIC ALGAE IN A DELAWARE SALT MARSH,
Rook Coll., New Brunswick, N. J. Dept. of Entomology and Economic Zoology.
M. J. Sullivan, and F. C. Daiber.
Journal of Experimental Marine Biology and Ecology, Vol 18, p 79-88, 1975. 3 tab, 13 ref.

Descriptors: *Benthic flora, *Limiting factors, *Algae, *Salt marshes, *Light intensity, Nitrogen, Phosphorus, Delaware, Tidal effects, Productivity, Standing crops, Cycles, Chlorophyll, Diatoms.
Identifiers: Canary Creek(Dela.), Spartina alterniflora, Delaware Estuary.

The environmental factors which regulate the production and species composition of the edaphic algal standing crop during the yearly cycle, the effects of changing light intensity and adding inorganic nitrogen and phosphorus as fertilizer to the surface of the Canary Creek salt marsh, Lewes, Delaware, were studied on algae associated with a pure stand of cord grass, Spartina alterniflora. The standing crop of edaphic algae, measured by chlorophyll-a production, was limited by phosphorus during the fall and winter, by both phosphorus and nitrogen in the spring, and only by nitrogen in the summer. Responses were in phase with seasonal fluctuations of phosphorus and nitrogen, thus it is concluded that the flood tide was the major source of nitrogen and phosphorus compounds for the algal growth. Reduction in the amount of light reaching the algae because of the Spartina cover was always a limiting factor for the standing crop. A gradient in algal flora composition was directly related to light intensity, and indicated that light intensity determined the relative contribution of diatoms and filamentous algae to the community. In the Delaware salt marshes and further north, only the algal component remains functional throughout a yearly cycle and a significant portion of its production is at a time when the grasses are dormant. (Buchanan-Davidson--Wisconsin)

ALGAE OF DAM RESERVOIRS IN THE SOLA CASCADE AND NEIGHBOURING SECTORS OF THE RIVER,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
K. Kyselowa, and L. Krzeczkowska-Woloszyn.
Acta Hydrobiologica, Vol 16, No 3-4, p 401-416, 1974. 4 fig, 3 tab, 15 ref.

Descriptors: *Algae, *Reservoirs, *Seston, *Periphyton, Rivers, Eutrophication, Self-purification, Sphaerotilus, Aquatic bacteria, Diatoms, Cyanophyta, Dominant organisms, Water pollution effects, Chrysophyta, Plankton, Euglenophyta, Europe.
Identifiers: Cascade reservoirs, Sola River(Poland), Porabka Reservoir(Poland), Tresna Reservoir(Poland), Czaniec Reservoir(Poland).

The influence of damming the Sola River, Poland, on seston and periphyton communities of the river and plankton of the reservoirs was studied. Above the Tresna Reservoir, Sphaerotilus natans, other bacteria, and colorless flagellata were observed on the left bank, and diatoms and blue-green algae on the right bank. These differences may have been due to sewage inflow. The periphyton and seston indicated pollution in this area. Below the dam a few Sphaerotilus natans were observed and the periphyton composition indicated less pollution. In the three reservoirs Chrysophyceae were dominant in May, Bacilariophyceae in July and September, and algal numbers decreased in September. Algal numbers in the cascade did not change, but there was uneven development of certain algae, suggesting a decrease in eutrophication; however the types of algae were characteristic for waters with organic pollution. Water above the reservoir was more polluted than that below, indicating the influence of reservoirs on river purity. Dam reservoirs created favorable conditions for development of planktonic algae which are important in self-purification. Planktonic species developing in these reservoirs were found in sestion below the reservoirs. Diatoms originating in the river were observed in the reservoir plankton. (Buchanan-Davidson--Wisconsin)
W76-01150

NUTRIENTS AND ALGAE IN SOME CENTRAL IOWA STREAMS,
Iowa State Univ., Ames. Dept. of Zoology and Entomology.
S. P. Kilkus, J. D. LaPerriere, and R. W. Bachmann.
Journal Water Pollution Control Federation, Vol 47, No 7, p 1870-1879, 1975. 8 fig, 2 tab, 25 ref.

Descriptors: *Euthrophication, *Nutrients, *Algae, *Streams, Rivers, Iowa, Streamflow, Water pollution sources, Phosphorus compounds, Nitrogen compounds, Diatoms, Mathematical studies.

Suspended algae and plant nutrients were measured in streams near Ames, Iowa. Nutrient levels were high averaging, 0.16 mg/l orthophosphate phosphorus, 0.54 mg/l ammonia nitrogen, and 1.75 mg/l nitrate nitrogen. Correlations between phosphate, ammonia nitrogen, and nitrate nitrogen and adjusted flows were significant and positive; correlations between human population densities and ammonia nitrogen and nitrate nitrogen were not. A significant correlation with orthophosphate phosphorus and human population was found, however, but phosphorus sources unrelated to urban density were of greater importance. Concentrations of phosphate nitrate, and ammonia increased with increase in flow. Removal of phosphorus from wastewater effluents through tertiary treatment would have little effect on nutrient concentrations. Logarithmic average mean algal populations were 54.7 mg chlorophyll-a/cu m and 24,500 cells/ml. Diatoms were dominant, followed by Scenedesmus and Oscillatoria. The larger the watershed, the higher the average chlorophyll-a concentration. High algal chlorophyll levels were associated with low flow periods. Algal carbon-14 uptake was not stimulated when phosphorus or nitrogen were added. Algae did not reduce phosphorus and nitrogen to limiting levels during flow; volume of flow, drainage area, and temperature were associated with 50% of chlorophyll-a variance. (Buchanan-Davidson--Wisconsin).
W76-01152

A STUDY OF THE BENTHIC ALGAE IN THE KELP BED OFF DEL MONTE BEACH, MONTEREY, CALIFORNIA,
Naval Postgraduate School, Monterey, Calif.
J. L. Keithly.
Available from the National Technical Information Service, Springfield Va 22161 as AD/A-005 465. MS thesis, December 1974. 143 p, 17 fig, 7 tab, 22 ref, 5 append.

Descriptors: *Marine algae, *Benthic flora, *Kelps, Coasts, California, Varieties, Periphyton, Distribution patterns, Surveys, Mapping.
Identifiers: *Del Monte Beach(Calif), *Monterey(Calif).

Approximately 50 benthic algal species and one eel grass specie were collected and identified. When 13 of the most abundant and/or easily recognized genera were classified into five floral groups according to taxonomy and height and mapped if they were found in pre-selected quadrat sites, abundance of each genera group was less in large sand covered shale areas, greater near shale ledge edge areas, and dependent on genera grouping when within Macrocystis 'hold-fast near field areas.' The mean number of stipes counted per holdfast decreased between winter and summer collections. Aerial photography over a five year period revealed that the kelp canopy showed a substantial size increase between October 1971-December 1972. Kelp beds near the city of Monterey sewer outfall appeared to be receding into deeper water from October 1971-January 1974. Theoretical wave refraction energy computations appeared consistent with the presence of Zostera

LIBRARY U. OF I. URBANA-CHAMPAIGN

and the best developed Cystoseira and Dictyoneuropsis in predicted calm water areas, as well as presence of Nereocystis and Pterygophora in predicted high wave energy areas. A species list and their ecological distribution is appended. (Buchanan-Davidson--Wisconsin)

SODIUM: A FACTOR IN GROWTH OF BLUE-GREEN ALGAE,
Michigan State Univ., East Lansing. Dept. of Botany.
A. K. Ward.
Available from the National Technical Information Service Springfield, Va 22161 as COO 1599 84, $4.00 in paper copy, $2.25 in microfiche. MS thesis, 1974. 48 p, 11 fig, 2 tab, 38 ref. AEC AT-(11-1)-1599, COO-1599-84.

Descriptors: *Algae, *Cyanophyta, *Sodium, *Inhibition, Growth rates, Anabaena, Nitrates, Nitrogen, Carbon, Metabolism, Laboratory tests, Nitrogen fixation, Sodium chloride, Photosynthesis, On-site tests, Michigan, Limiting factors.
Identifiers: Anabaena cylindrica, Organic carbon excretion, Wintergreen Lake(Mich).

Response of axenic cultures of Anabaena cylindrica to sodium and nitrate was examined, with special emphasis on aspects of nitrogen and carbon metabolism. In situ sodium enrichment bioassays were employed to ascertain response of natural populations of heterocystous blue-green algae to sodium additions. Acetylene reduction was used to compare nitrogen-fixing ability of blue-green algae. Assimilation of inorganic radioactive carbon was used to determine photosynthetic carbon fixation rates. With no added sodium chloride, cultures showed decreased acetylene reduction, C14 assimilation, organic carbon excretion, chlorophyll-a, and particulate organic carbon compared to cultures with added sodium. Sodium deficient cultures released more previously fixed carbon as organic carbon. No differences were demonstrated with higher sodium concentrations. High nitrate concentrations caused decreased rates of acetylene reduction and heterocyst numbers in sodium sufficient and sodium deficient cultures; decreased particulate organic nitrogen content at high nitrate levels occurred only in sodium deficient cultures. Higher percentages of excreted organic carbon occurred with increasing nitrate concentrations in sodium deficient cultures. Sodium enrichment bioassays in Wintergreen Lake, Michigan, indicated increased photosynthetic carbon fixation with small additions of sodium but higher concentrations had no effect. No increase in in situ acetylene reduction rates occurred among natural populations with added sodium. (Buchanan-Davidson--Wisconsin)

PHYTOPLANKTON COMPOSITION OF A SMALL SUBARCTIC LAKE IN THE NORTHWEST TERRITORIES, CANADA,
Toronto Univ. (Ontario). Dept. of Botany.
R. Sheath, and M. Munawar.
Phycologia, Vol 13, No 2, p 149-161, 1974. 3 fig, 2 plates, 1 tab, 61 ref.

Descriptors: *Biological communities, *Phytoplankton, *Subarctic, *Lakes, Canada, Varieties, Speciation, Diatoms, Chlorophyta, Cyanophyta, Dinoflagellates, Euglena, Chrysophyta, Plant morphology, Pyrrophyta, Nannonplankton, Trophic level.
Identifiers: *Hanna Lake(Canada), Norman Wells(Northwest Territories).

A qualitative survey of phytoplankton is subarctic Hanna Lake, near Norman Wells, Northwest Territories, showed that during the ice-free period, there were 81 common taxa. Major groups accounting for 83.9% of the total species were Diatomeae, Chlorophyta, and Cyanophyta. Chrysomonads, cryptomonads, Heterokontae, and dinoflagellates comprised 16% of the species. There were no Euglenophyta. Dominating morphological forms were nonmotile unicells and colonies; 12% were phytoflagellates and 14% filamentous. Comparisons with other subarctic and arctic lakes indicated that diversity of taxonomic groups and morphological forms was not restricted by increasing latitudes. Nanoplankton species outnumbered net plankton. Of the net plankton, 62% were filamentous blue-green algae and diatoms. Of the nanoplankton, the largest group was the 21-40 micrometer size. The only ultraplankton was Erkenia subaequiciliata. Phytoplankton quotients were: Myxophycean 3.2, Chlorophycean 2.5, diatom 0, and compound 5.7; except for the diatom quotient, these were in the range for eutrophic lakes. Algal species numbers were very ephemeral. Concurrent with a decrease in diatom numbers, a rapid increase in species numbers (primarily Chlorophyta and Cyanophyta) occurred during the summer. Eutrophic conditions appeared to occur naturally in this lake, as shown by nutrient levels, species composition, phytoplankton quotients, and ration of net plankton/nanoplankton. (Buchanan-Davidson--Wisconsin)

THE RAPID QUANTITATION OF THE FILAMENTOUS BLUE-GREEN ALGA PLECTONEMA BORYANUM BY THE LUCIFERASE ASSAY FOR ATP,
Delaware State Coll., Dover. Dept. of Biology.
V. H. Bush.
Available from the National Technical Information Service, Springfield, Va 22161, as N74 33527, $3.50 in paper copy, $2.25 in microfiche. Report 1974. 20 p, 4 fig, 4 tab, 7 ref. NASA 08002-003.

Descriptors: *Analytical techniques, *Biomass, *Algae, Cyanophyta, Measurement, Population, Assay.
Identifiers: *Luciferase, Plectonema boryanum, Adenosine triphosphate.

Microscopic cell counts, luciferase assay for ATP, and optical density measurements were used to quantitatively measure populations of Plectonema boryanum, a filamentous blue-green alga. Disruption of the gelatinous sheath without disrupting the cells is a prerequisite for accurate cell counting, but various physical and chemical means (ultrasonic sound, heat, freezing, nitric acid, pineapple juice, sodium hydroxide, Triton X-100) were unsuccessful. When five-day-old cultures of P. boryanum were diluted with growth medium, there was a linear relationship between the three methods and algal population but the luciferase method for determining ATP was the most rapid and accurate. ATP was determined by extracting tle cells with 2N nitric acid, and amount of extractable ATP measured by the bioluminescent firefly luciferase reaction. This study was limited to P. boryanum of a given age and grown under specified conditions. (Buchanan-Davidson--Wisconsin)

CHEMICAL AND MICROBIOLOGICAL STUDIES OF THE MIDDLE SALT LAGOON, BARROW, ALASKA,
Colorado State Univ., Fort Collins. Dept. of Microbiology.
W. L. Boyd, and J. W. Boyd.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-001 229, $4.00 in paper copy, $2.25 in microfiche. Final Report September 1974. 45 p, 5 fig, 14 tab, 19 ref. ONR NOOO14-67A-0299-0015.

Descriptors: *Saline lakes, *Chemical properties, *Arctic, *Biota, Alaska, Bacteria, Sewage effluents, Optical properties, Lagoons, Runoff, Bottom sediments, Halophytes.
Identifiers: Middle Salt Lagoon(Alaska), Barrow(Alaska).

The ecology of a salt lagoon, adjacent to Chukch Sea, was studied in 1971 1972 before installatio of a sewage treatment plant. The lagoon was use as a depository for sewage from the Naval Arcti Research Laboratory. Although it seemed like a ideal component of a two cell disposal system with concentration during winter and dilution int the sea in summer, this was not the case. Littl sludge flushed out of the main basin during runoff Runoff and melt water flowed over denser layers probably resulting in a greater dilution after th sea channel had been closed. A slow turnover rat of soluble bottom material occurred for 2- months. Phosphorus concentration was low excep at the sewage outfall and there was no evidence o eutrophication despite the use of detergents. Am monianitrogen was high, but nitrate- and nitrite nitrogen were only found occassionally in shallow areas. Pollution indicator organisms were low, ex cept in bottom sediments because of the outfal design. Marine and halophilic bacteria were sig nificant during the ice-free period. The lagoon ha no odor and was clear except near the bottom Most of the microbial populations were associate with bottom sediments. (Buchanan-Davidson--Wisconsin)

BLOOMS OF SURF-ZONE DIATOMS ALONG THE COAST OF THE OLYMPIC PENINSULA WASHGINTON. V. ENVIRONMENTAL CONDITIONS ASSOCIATED WITH THE BLOOMS (1971 AND 1972),
Washington Univ., Seattle. Dept. of Oceanography.
J. Lewin, T. Hruby, and D. Mackas.
Estuarine and Coastal Marine Science, Vol 3, No 2, p 229-241, 1975. 7 fig, 1 plate, 15 ref. NSF GA 27498, AEC AT(45-1) 2225, TA26.

Descriptors: *Ecological distribution, *Marine algae, *Diatoms, *Surf, Washington, Pacific Coast Region, Coasts, Phosphates, Salinity, Water temperature, Nutrients, Nitrates, Silicates, Diurnal distribution, Ammonia.
Identifiers: Surf diatoms, Copalis Beach(Wash.), Chaetoceros armatum, Asterionella socialis, Biddulphia aurita, Olympic Peninsula(Wash.).

Environmental conditions associated with heavy diatom blooms in 1971-2 at Copalis Beach, Washington, were monitored. Chaetoceros armatum was always present; Asterionella socialis disappeared in late summer and autumn of 1972 when there was upwelling of oceanic water. Biddulphia aurita (of minor importance in blooms) was present in late winter and spring. These species are physiologically adaptable and are able to tolerate and grow in widely fluctuating temperatures, salinity, light, and nutrient levels. During April, salinity was low, silicate high, and nitrate decreased due to mixing of ocean and river waters which were both low in nitrate. Duration of nitrate depletion depended on intensity of deep oceanic water upwelling (influenced by magnitude and duration of northerly winds and river runoff) Populations did not become significantly nutrient-limited; while nitrates were low ammonium was present. C. armatum nitrate reductase was low when nitrate was absent in summer. Length of A. socialis disappearance depended on magnitude of upwelling, possibly caused by increase in salinity. entifiers: France.

rackish ecosystems for water pollution biassay ere established in tanks filled with diluted sea ater, kept at 19C, lighted for 12 hours, and eated with sediment and biocenoses from the Ar-chon Basin ponds, France. Plant material con-sted of Chaetomorpha lineum and Cladophora rriendii, which sheltered abundant fauna. Dur-g the year Spirulina subsalsa repeatedly bloomed d some Chaetomorpha decayed. After a year pirulina subsales, Oscillatoria chalybea, Lyngbya tea, Ulvella, Exuviella, and diatoms were tablished. Much of the microflora epiphytes of haetomorpha and Cladophora disappeared and a w characteristic macroflora developed. Another atom community was established in the Spirulina atting which was rich in organic matter from haetomorpha decomposition. There were acrofauna and microfauna. All macrofauna spe-es brought with the algae were supported, but ult forms seemed less numerous than young rms and some species underwent a dramatic velopment, e.g., Sagartia. During the first three onths numerous species disappeared. Spirulae used alternating periods of growth and generation, with the variations in algal develop-ent and phosphate concentrations synchronized. ter four months, the periphyton was more diver-ied and persistent and Spirulina developed, es-ntially destroying Chaetomorpha and adophora. A characteristic flora established it-lf in the spirulae mollusks. (Buchanan-David-n-Wisconsin)

entifiers: *Llangorse Lake(Wales), Myx-hyceae.

nsiderable recreational stress is placed on this e due to its proximity to large industrial areas of uth Wales and the Midlands. Data collected in 61-1962 and in 1966-1967 concerning nutrients d phytoplankton are compared. This shallow e is almost homothermal. The pH increases in mmer and early autumn. Nutrient levels in the lowing river, Afon Llynfi, remained relatively astant except during high volume in winter. Sil-concentration rose to a maximum in late mmer and autumn, but winter diatoms caused pletion. Phosphate was high in early summer d low in winter; the phosphate level had in-ased between 1961 and 1966. Total hardness s constant except when diluted by winter rains. rites reached a peak in early summer and in ly winter in Afon Llynfi. Maximum phytoplankton growth was associated with high lake water temperatures and macronutrient concentrations. Periodicity in major phytoplankton species is detailed. The winter burst of diatoms was followed by a spring increase of green algae. Increasing lake water temperatures and hydrogen ion concentrations in late summer were associated with increases in Cyanophyta. Microcystis flos-aquae blooms were noted in both years, but the bloom was twice as high in 1966 as in 1961. Species of phytoplankton, epiphytes, and epiliths are given. (Buchanan-Davidson--Wisconsin)

COMMUNITIES OF THE PERIPHYTON ALGAE OF CHANNEL LAKES OF BYSZEWO,
Nicolas Copernicus Univ. of Torun (Poland). Dept. of Systematics and Plant Geography.
M. Luscinska.
Acta Universitatis Nicolai Copernici, Limnological Paper No 8, p 35-45, 1974. 5 fig, 3 tab, 4 ref.

Descriptors: *Biological communities, *Periphyton, *Aquatic algae, Water quality, Lakes, Systematics, Mesotrophy, Spring, Diatoms, Chlorophyta, Hardness(Water), Summer, Littoral, Calcium.
Identifiers: *Byszewo lakes(Poland).

One hundred and fifty one periphyton taxa were found in the littoral zone of 10 channel lakes of Byszewo, Poland, of which 32 were planktonic or benthic. Most of the components of these communities were diatoms and adhered to the larger algae of the upper layers; others were attached to substrata. The second largest group was the Chlorophyceae, most of the them belonging to the Chaetophorales. Most of the taxa were characteristic of the periphyton of eutrophic lakes. Periphyton collected in May from young reeds and those growing from last year's reeds showed only slight differences. In September some filamentous algae were found which were not found in May. The association of Oedogonio-Epithemietum litoralae indicated the high purity of the littoral waters. This association is characteristic of eutrophic lakes rich in calcium but unpolluted with other nutrients and organic substances. (Buchanan-Davidson--Wisconsin).

PHYTOPLANKTON SUCCESSIONS AND SPECIES DISTRIBUTION IN PRAIRIE PONDS OF THE ERICKSON-ELPHINSTONE DISTRICT, SOUTHWESTERN MANITOBA,

H. Kling.
Canada Department of the Environment, Fisheries and Marine Service Technical Report No 512, 1975. 33 p, 5 fig, 2 tab, 28 ref.

Descriptors: *Phytoplankton, *Succession, *Varieties, *Distribution, *Potholes, Lakes, Canada, Trophic level, Euthrophication, Biomass, Dominant organisms.
Identifiers: Erickson-Elphinstone(Manitoba).

Phytoplankton of 50 small prairie pothole lakes in the Erickson-Elphinstone region of Manitoba have been surveyed since 1972. Seasonal succession studies were conducted in five lakes in 1973. These lakes are very eutrophic with midsummer maximum biomass values above 10,000 mg/cu m. The phytoplankton were mainly Cyanophyta. Peridinae became dominant in a few lakes during certain years, although they were usually of minor importance. When dominant, Ceratium hirundinella was the only species present. A total of 237 taxa were identified in these lakes from 1972-1974. It would appear that the more eutrophic the lake, the fewer species were present. Spring and fall samples generally contained more species than summer and winter samples. These lakes could be generally classified as having mesotrophic or eutrophic dinoflagellate plankton, eutrophic chloroccal plankton, and cyanophycean plankton. When the lakes were compared on the basis of their summer maximum biomass and predominance of various algal groups, there was increased predominance of Cyanophyta of Chlorophyta as the lakes became more eutrophic (indicated by areas which increased biomass). Those with lower biomass values and nutrients showed a predominance of Chrysophyceae. The Erickson-Elphinstone lakes are highly eutrophic with high summer maximum biomass values and high Cyanophyta dominance. (Buchanan-Davidson-Wisconsin)

CHANGE IN PLANKTONIC COMPLEXES IN THE EUTROPHIC LAKE BALTYM DUE TO OVERGROWTH BY WEED,
Ural and Siberian Fishery Scientific-Research and Planning Inst. Sverdlovsk (USSR).
I. V. Kozlova.
UDC 577.472(26). Translated from Ekologiya, No 4, p 104-107, 1973. Published by Consultants Bureau, Div. of Plenum Publishing Corp, New York City. 1 tab, 5 ref.

Descriptors: *Eutrophication, *Aquatic weeds, *Phytoplankton, *Zooplankton, Rotifers, Daphnia, Biological communities, Cyanophyta, Chlorophyta, Biomass, Chrysophyta, Crustaceans, Nostoc, Fish.
Identifiers: *Lake Baltym(USSR).

Changes in species composition and zooplankton development in relation to aquatic vegetation overgrowth in Lake Baltym, USSR, are discussed. Before 1950, there was little overgrowth; in 1952, aquatic vegetation spread and by 1962 occupied almost 50% of the bottom. Eutrophication occurred due to shoreline developments and absence of seine netting. Hornwort beds covered the center and some parts were solid masses of elodea, milfoil, and pondweed. In 1962 a blue-green and green algae bloom occurred. Daphnia and Mesocyclops oithonoides disappeared, and Eudiaptomus graciloides, Mesocyclops leuckarti, Bosmina mixta, Ceriodaphnia pulchella, and C. quadrangula increased. Macrophytes spread caused changes in phyto- and zooplankton communities. Blue-green algae and chrysophytes bloomed in 1965. In 1970 aquatic vegetation covered most of the lake bottom. Hornwort and Elodea were most abundant. The lake 'bloomed' with green algae, chrysophytes, and blue-green algae. Elodea, milfoil, pondweed, reeds, Nostoc, Bosmina longirostris, Ceriodaphnia pulchella, and Mesocyclops leuckarti attained high density. Eudiaptomus graciloides was low. Rotifers constituted 49.5% of total biomass. Zooplankton were low in 1970. Reduction of crustaceans indicated deteriorating growth conditions. Restoration of the planktonic food base will necessitate removal of vegetation (which suppressed many pelagic zooplankton) by stocking with phytophagous fish, Ctenopharyngodon idella and Hypophthalmichthys molitrix. (Buchanan-Davidson--Wisconsin)

THE ALGAE OF SALINE AREAS NEAR VLISSINGEN (THE NETHERLANDS),
Leiden Rijksherbarium (Netherlands).
P. J. G. Polderman.
Acta Botanica Neerlandica, Vol 23, No 2, p 65-79, 1974. 5 fig, 1 tab, 27 ref.

Descriptors: *Algae, *Brackish water, *Saline water, *Vegetation, Saline water intrusion, Dominant organisms, Period of growth, Biological communities, Distribution patterns, Varieties, Systematics, Europe.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Identifiers: Vlissingen(Netherlands), Puccinellietum fasciculatae, Juncetum gerardii, Vaucheria.

Composition and periodicity of algal mats in saline seepage areas on the landward side of dikes near Vlissingen, The Netherlands, are described. Puccinellietum fasciculatae was the predominant higher plant in areas higher in salinity than those inhabited by Juncetum gerardii. Rhizoclonium riparium was usually the most important algae, but was occasionally replaced by Vaucheria. Blue-green algae, Nodularia harveyana and Schizothrix calcicola, were always present. Some periodicity in growth of green algae, Ulothrix subflaccida and U. pseudoflacca, was observed. Algal cover often decreased at the end of May. Substrate, water regime, higher plant density, desiccation, and mode of growth influenced algal cover. Rhizoclonium grew better in summer and autumn and Ulothrix peaked in winter. Apistonema were the only algae found in salt crusts in summer. Differences in algal species composition in Juncetum gerardii and Puccinellietum fasciculatae were small. Plots could be distinguished by the Vaucheria species present. In saline areas of North Holland, only Juncetum gerardii was found. Ecological boundaries of algal species were different from those of higher plants. Classification of algae in saline environments must be based on investigations of large areas with diverse terrain made each season for several years. (Buchanan-Davidson--Wisconsin)

SOME CARPATHIAN RESERVOIRS AND THEIR PRODUCTION RELATIONS,
Polish Academy of Sciences, Krakow (Poland). Zaklad Biologii Wod.
M. Bombowna, and H. Bucka.
Acta Hydrobiologica, Vol 16, No. 3-4, 1974. p 379-400, 11 fig, 4 tab, 14 ref.

Descriptors: *Reservoirs, *Productivity, Chemical properties, Phytoplankton, Primary productivity, Chlorophyll, Diatoms, Chrysophyta, Chlorophyta, Dominant organisms, Nutrients, Europe, Watersheds(Basins), Phosphates, Waste water(Pollution), Biomass, Photosynthesis, Algae, Trophic level.
Identifiers: Sola cascade reservoirs(Poland), Vistula River(Poland).

Chemical relations, phytoplankton primary production, and chlorophyll content in two reservoirs of the Sola cascade and a lowland reservoir at Goczolkowice, Poland, were compared, to determine if production depended on chemical composition of water or reservoir type. Diatoms dominated the algal communities; Cyclotella comta and Cryptomonas erosa were present in all reservoirs and Chrysococcus in Goczalkowice. Green algae increased at the end of summer with Nephrochlamys Willeana in all reservoirs and Raphidonema longiseta and Dictyosphaerium pulchellum at Tresna and Porabka. Fertility depended on nutrient inflow from the catchment areas. Sufficient phosphates were present even in summer due to municipal waste inflows. Asterionella formosa appeared at the beginning of summer. Morphometric features did not significantly influence production in Tresna and Goczalkowice reservoirs. Chlorophyll-a concentration could be positively correlated with production and nutrient content. Phytoplankton renewal time was a good indication of photosynthetic activity. Decrease in productivity down the cascade and increase in algae characteristic of clean water at Porabka indicated a favorable response to a system of reservoirs on a river. Eutrophication was moderate, but greater in the Tresna reservoir due to a short filling period and sewage inflow from Zywiec causing less production stability than in the Goczalkowice reservoir.

HEAVY-METAL TOLERANCE IN ALGAE FROM CONTAMINATED LAKES NEAR SUDBURY, ONTARIO,
Toronto Univ. (Ontario). Dept. of Botany.
P. M. Stokes, T. C. Hutchinson, and K. Krauter.
Can J Bot. Vol 51, No 11, p 2155-2168. 1973.
Identifiers: *Algae, *Bioassay, *Canada(Sudburg), Chlorella-Fusca-Var-Vacuolata, *Heavy metals, Copper, EDTA, Lakes, Nickel, Nutrients, Scenedesmus-Acutiformis-Var-Alternan, Hydrogen ion concentration.

Chemical analyses of lake waters in the Sudbury (Canada) smelting area indicated abnormally high levels of metals, especially of Cu and Ni. Two of the algal isolates from these contaminated lakes, Scenedesmus (acutiformis var. alternans) and Chlorella (fusca var vacuolata), were chosen for study. Their growth, as determined by cell number, was tested under controlled conditions in defined media. Nutrient conditions, pH, and concentration in solution Cu and Ni were used as variables in bioassays. In comparison with laboratory strains of similar algae, in medium with no chelate (EDTA) the isolated lake strains were found to be tolerant of the heavy metals N (Scenedesmus) and Cu (Scenedesmus and Chlorella). The patterns of response to metals in solution differed markedly between laboratory and lake strains. The ecological implications are considered.--Copyright 1974, Biological Abstracts, Inc.

STUDIES ON THE DECOMPOSITION OF A DUCKWEED (LAMNACEAE) COMMUNITY,
Allegheny Coll., Meadville, Pa. Dept. of Biology.
H. R. Laube, and J. R. Wohler.
Bull Torrey Bot Club. Vol 100, No 4, p 238-240. 1973. Illus.
Identifiers: *Decomposition, Dry matter, *Duckweed, Lemna-Minor, Lemna-Trisulca, Lemnaceae, Magnesium, Manganese, *Pennsylvania, Sodium, Spirodela-Polyrrhize, Temperature, Wolffia-Columbiana, Ponds.

During the late summer and fall of 1971 and 1972, decomposition of even-dried duckweeds (Spirodela polyrhize, Lemna minor, L. trisulca, and, in late summer, Wolffia columbiana) returned to a small pond in northwestern Pennsylvania was monitored and samples analyzed for the loss of dry weight, organic weight, inorganic weight, M, Mn and Na. A laboratory study also performed to measure loss of the above at 10 C and 20 C. Results of these studies indicate that within one week, at least 20% of the dry matter is lost and that over 50% of the M, Mn and Na are lost within 3 weeks.--Copyright 1974, Biological Abstracts, Inc.

THE ALGAL MICROFLORA OF A STRING MIRE IN RELATION TO THE CHEMICAL COMPOSITION OF WATER,
Lund Univ. (Sweden). Dept. of Ecological Botany.
T. Flensburg, and J. H. Sparling.
Can J Bot, Vol 51, No 4, p 743-749. 1973.
Identifiers: *Algal species diversity, Bogs, *Chemical composition, *Desmidiales, Evastrum, Flora, Lakes, Micrasterias, Nutrients, Sphagnum-Rubellum, Stauragstrum, *String mire.

Samples (21) were examined for algal species diversity. Samples contained between one and 35 species with a mean of 10.6 species/sample. The greatest diversity of species occurred in samples collected from large flarks or bog lakes. Hummock communities, especially those with abundant Sphagnum rubellum contained fewest algae. All samples showed a predominance of Desmidiales. General ionic levels in the string mire were low; however, species of the genera Euastrum, Micrasterias and Staurastrum occurred frequently in the sites richer in nutrients. More species were found in water than in drier sites. The presence of species characteristic of more base-rich conditions may be related to the rate of water flow through the mire.--Copyright 1974, Biological Abstrac Inc.

Moreton's Harbor, Newfoundland, has been posed to arsenic-bearing drainage and leach from a stibnite mine for at least 38 yr and possi longer than 84 yr. Measurements of inorganic senic in sea water and sediments and total arse in some marine organisms revealed a very limi influence of continuous exposure to arsenic in small harbor. Arsenic concentrations in surf water declined to normal within 200 m, and in se ments within 50 m. Animals did not show sign cantly higher levels nearer the mine, with the ception of the sea urchin Strongylocentro droebachiensis, which accumulated significan higher levels of arsenic adjacent to the mine s (Henley-ISWS)

, October 1975. 9 fig, 4 tab, 31 ref.

scriptors: *Activated sludge, *Curves,
raphs, *Environmental engineering, *Waste
atment, *Sedimentation, Wastewater, Kinetics,
thematical models, Design, Systems analysis,
uations, Economics, Aeration, Costs.
ntifiers: Settling, Thickening.

gineers involved with the preliminary design of
wastewater treatment system must efficiently
luate the economic impact of many alternative
cess schemes. Among the factors to consider
en evaluating the completely mixed activated
dge process are the interaction between the
ation tank and the final settler and the effect it
on the total system cost. Optimization of aera-
n and final settling tank sizes requires that
per consideration be given to the thickening
ction of the final settler. Design graphs are
sented to facilitate a rational determination of
cess unit sizes, accounting for the interaction
ween aeration and final settling tanks. The
phs for aeration tank performance are based
n mean cell residence time as the main biologi-
process parameter, while those describing final
ler operation incorporate the solids flux con-
t with the subsidence velocity expressed as a
rithmic function of the solids concentration. In
er to aid the engineer in the use of the charts,
ues of the parameters characterizing microbial
wth and sludge settling, as found in the litera-
for various industrial and municipal wastes,
presented in tabular form. The key feature of
graphs is that they allow consideration of the
ct of mixed liquor suspended solids concentra-
upon the sizing of both the aeration chamber
the final settler. Because computational time
educed to a minimum, the design engineer can
kly arrive at the MLSS concentration that
lts in the least-cost design. (Bell-Cornell)

AVERT RUNOFF POLLUTION,
W. Waltner, and E. Waltner.
Feedlot Management, Vol 15, No 5, p 35-37, May, 1973. 3 fig.

Descriptors: *Runoff, *Feed lots, *Farm wastes, *Irrigation, *Evaporation, *Playas, *Lagoons, *Waste storage, *Waste disposal, Agricultural runoff, Control, Solid wastes, Water pollution, *Drainage water.
Identifiers: Pump-out system, Land disposal.

Various evaporation and irrigation systems are used to prevent runoff pollution. Several specific feedlots and their runoff control measures are cited for feeders located in the Southwest. Some feedlot owners direct their feedlot runoff into playas. Others construct lagoons to catch the runoff and to provide a means of irrigation of adjoining land. Others use septic tanks to store the runoff water. The water is then pumped to irrigate adjoining fields. An Oklahoman constructed 2 storage ponds for consecutive storage of the wastewater and ultimate evaporation when it is pumped into shallow evaporation pans. Solids are removed to a storage area for composting. These and other systems constructed to meet individual feedlot problems show that while big feedlots in the southwest states are comparatively 'young', they are mature in grappling with pollution runoff control. (Cameron-East Central Oklahoma State)

EXPERIENCE WITH A SPRAY-RUNOFF SYSTEM FOR TREATING BEEF CATTLE FEEDLOT RUNOFF.
Kansas State Univ., Manhattan. Dept. of Agricultural Engineering.
D. E. Eisenhauer, R. I. Lipper, and H. L. Manges.
Presented at 1973 Mid-Central Meeting, American Society of Agricultural Engineers, St. Joseph, Missouri, April 6-7, 1973, Paper No MC-73-302, 22 p. 2 fig, 11 tab, 6 ref.

Descriptors: *Waste treatment, *Cattle, *Feed lots, *Runoff, Biochemical oxygen demand, Nitrogen, Salinity, Alkalinity, Soil profile, Waste disposal.
Identifiers: *Spray-runoff system, *Pollution.

An experimental study was conducted to examine the spray-runoff technique as a possible alternative to disposal practices of beef cattle feedlot runoff. A detailed discussion of the construction of the system and test results are given. While treatment of the feedlot runoff by using the spray-runoff system did occur, a satisfactory effluent for direct release to the environment was not produced. Concentration reductions of BOD5 and Kjeldahl nitrogen were from 40-60 percent under the most favorable conditions. Mass reductions of BOD5 and Kjeldahl nitrogen were as high as 90 percent. Accumulations of salt, sodium and potassium were found in the soil profile after 29 inches of the wastewater had been applied but no serious saline or alkali hazards had developed. SLUDGE DISPOSAL: A CASE OF LIMITED ALTERNATIVES.
Deeds and Data, p D-1--D-4 December, 1971.

Descriptors: *Sludge disposal, *Waste treatment, *Waste disposal, Fertilizers, Irrigation, Soils, Incineration, Lagoons.
Identifiers: Land disposal, Ocean disposal.

A panel discussed alternatives for sludge disposal. Some treatment plants can transport sludge to crop lands. Guidelines can be written for heated anaerobically digested sludge to be applied at rates up to 100 dry tons/acres for any soil type. Cadmium, lead, mercury, copper and chromium in the sludge do not appear to be detrimental to crops. There are also extremely few pathogen problems. Cities like New York, however, don't have available land to dispose of effluent. Other disposal methods are incineration, ocean disposal, and lagooning. Very little survey work cost data has been published on various methods of sludge disposal. It is obvious that much more experimentation and research is needed in order to solve the sludge disposal problem. (Wetherill-East Central Oklahoma State)

Descriptors: *Farm wastes, *Waste storage, *Waste disposal, *Groundwater pollution, *Nitrates, Leakage, Denitrification, Biochemical oxygen demand, Salts, Tensiometers, Seepage Poultry, Soils, Percolation, Salinity control.
Identifiers: *Holding ponds, *Manure.

Seventeen manure holding ponds were studied to determine rates at which the ponds sealed against leakage into underlying groundwater, rates of denitrification in the ponds and stratification of chemical constituents and BOD within the ponds. Additionally, the fate of nitrates and other salts were evaluated when field-dried manure was applied as fertilizer. Tensiometric techniques were used to determine hydraulic potential gradients and to obtain samples of the soil solution beneath the ponds. The solutions were analyzed for pH, total dissolved solids (TDS), and nitrates. In addition to the analyses of the solution, soil samples taken by auger just outside the edge of the ponds from the same depths were analyzed for nitrates abd TDS. Even on coarse textured soils, ponds effectively sealed in 60 days or less. Almost no salt was lost from the ponds, but there was substantial denitrification. Applications of 40 yards of manure per acre resulted in higher nitrates in percolating leachates and slightly higher salinity than applications of 12 yards of manure per acre. BIOLOGICAL TREATMENT OF FEEDLOT RUNOFF FOLLOWING SETTLING,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
T. J. McGhee.
Presented at the 66th Annual Meeting, American Society of Agricultural Engineers, University of Kentucky, Lexington, June 17-20, 1973; Paper No. 73-413, 19 p. 12 fig, 1 tab, 13 ref.

Descriptors: *Feed lots, *Farm wastes, *Runoff, *Waste treatment, *Biological treatment, Activated sludge, Design, Costs, Chemical oxygen demand, Effluents, *Agricultural runoff.
Identifiers: Settling.

An activated sludge system designed for the treatment of settled feedlot runoff has been studied both in the laboratory and in the field. Initial studies utilizing the gravity solids return system demonstrated that reductions in COD of approximately 60% were attainable at liquid retention times of 4 days or more. From the data obtained in the laboratory study, it was concluded that the field system should be designed to operate at a liquid retention time of two days or more and at an organic loading rate of less than 1.0 lb. COD per lb. MLSS per day. Calculations based upon the average annual runoff from the lots and of the annual rates of precipitation and evaporation in eastern Nebraska indicated that the required volume would be 890 gallons assuming that operation would be possible for 180 days per year. The cost of effectively treating settled feedlot runoff with an aerobic biological system has been estimated to be $0.65 per head for the climatic conditions of eastern Nebraska. This cost is dependent upon animal density, climate, and the balance between holding pond and treatment unit size. (Cartmell-East Central Oklahoma State)

COSTS NOTED FOR SOLID AND LIQUID WASTE SYSTEM.
Feedlot Management, Vol 15, p 58, January, 1973.

Descriptors: *Waste storage, *Waste disposal, *Liquid waste, *Farm wastes, *Costs, *Solid wastes, Settling basins, Lagoons, Irrigation, Legal aspects, Missouri.
Identifiers: *Manure, *Land disposal.

An animal waste disposal system was developed that meets Missouri law with respect to keeping waters of the state clean. Basically, the system involves returning waste solids and liquids to agricultural land and preventing them from getting into water resources. The liquids are drained off into a lagoon; the solids settle out in the settling basin. Solids are deposited on the land by using a conventional manure spreader. The liquids are spread through irrigation equipment. The annual costs to own and operate the system range from a low of $0.75 per head for a 400-head operation using the hand carry system to a high of $1.37 per head for a 1,200 head operation using the traveling gun system. DESIGN OF LONG INTERCEPTOR SEWERS,
Edinburgh City Engineer's Dept. (Scotland).
A. W. Blakey, G. F. McCreath, and M. G. D. Thomson.
Journal of the Institution of Municipal Engineers, Vol 99, No 12, p 388-343, December, 1972. 4 fig, 3 tab, 6 ref.

Descriptors: *Sewers, *Sewerage, Rainfall intensity, Computers, Hydrographs, Interceptor sewers.
Identifiers: Storm profiles.

A method of designing long interceptor sewers taking into account rainfall characteristics in assessing their flow-carrying capacity is described. The design procedure proposed involves examination of the effect of undulating storm profiles associated with prolonged nearly-continuous rainfall of moderate intensity as alternatives to the Bilham/Holland type of storm profile with its single peak of high rainfall intensities of relatively short duration. The use of a computer is essential due to the large number of calculations involved with a printout obtainable for each hydrograph with peak values reduced to simulate the effect of storm overflow devices. The final hydrograph printouts can be stored for use as input hydrographs on a final computer run for the sizing of the interceptor sewer using a sub-area technique. Alternatively, the input data file can be prepared to include all existing trunk sewer systems with the new interceptor sewer system and to specify maximum rate of flow values at overflow positions. This avoids the necessity for individual trunk sewer designs for each different storm profile used. (Sandoski-FIRL)
W76-01047

SEWER IN FLOOD PLAIN MUST FIGHT INFILTRATION.
Public Works, Vol 104, No 1, p 66-67, January, 1973. 2 fig.

Descriptors: *Plastic pipes, *Sewers, Flood plains, Missouri River, Infiltration, Flow rates, Installation, Pipes.
Identifiers: *Flextran.

The development of a 1300-acre balanced urban community built along the Missouri River resulted in high flow rate and tight infiltration specifications for the sewer line installed beneath the flood plains. Flextran, a new fiber glass reinforced polyester resin pipe made by Johns-Manville, was used for the sewer line. This flexible conduit is composed of polyester resin and siliceous sand, reinforced with continuous roving glass fibers, is completely non-metallic, and avoids electrolytic or galvanic corrosion. An isophthalic polyester resin gives the pipe its resilience, resistance to moisture, and high dimensional stability. This sand is a functional low-cost filler for wall thickness to meet the internal and external pipe requirements used in gravity transmission of water and waste water. By using Flextran, with its high flow rate, a reduction in sewer line slope as well as the number of pum ing stations was accomplished. Installation w fast and trouble free due to Flextran's lightweig and longer segment lengths. (Sandoski-FIRL)

STEM FOR REGULATION OF COMBINED WAGE FLOWS,
V. Gibbs, S. M. Alexander, and C. P. Leiser.
urnal of the Sanitary Engineering Division, nerican Society of Civil Engineers, Vol 98, No SA 6, p 951-972, December, 1972. 9 fig, 3 tab, 6 ref.

Descriptors: *Combined sewers, *Automatic control, *Sewers, Monitoring, Computers, Flow control.
Identifiers: Seattle, Washington, Computer Augmented Treatment and Disposal(CATAD).

As an alternative to the construction of separate drainage systems, the use of storage in trunk and interceptor sewers for regulation of combined sewage flow within the capacity of the interceptor is proposed. The computer-directed system, known as Computer Augmented Treatment and Disposal (CATAD), represents a procedure for maximum utilization of available storage in trunk and interceptor sewers to reduce or completely eliminate overflow. The CATAD system controls comprise a computer-based central facility for automatic control of remote regulator and pumping stations in Seattle, Washington. The installation of equipment at the central station and at 32 remote stations was completed in 1971. All required programming for data acquisition, central station console operation, satellite terminal operation, supervisory commanding, events recording, and data logging is now complete. The system is in continuous operation for system monitoring and is being tested for control in a supervisory mode. Routines for automatic control have been substantially completed and are being integrated systematically with other functions. (Sandoski-FIRL)

CENTRALIZED CONTROL SYSTEM OF SEWERAGE (GESUIDO SHUCHU SEIGYO SHISUTEMU),
T. Ohto, S. Nogita, H. Iwaki, S. Mori, and T. Onodera.
Hitachi Hyoron, Vol 54, No 10, p 919-923, October, 1972. 9 fig, 1 tab, 7 ref.

Descriptors: *Waste water treatment, *Sewerage, Storm runoff, Drainage practices, Sewage treatment, Activated sludge, Biochemical oxygen demand, Rainfall-runoff relationships, Water quality, Infiltration.
Identifiers: Japan, Toxic materials.

In the past, Japanese sewerage water drainage practices were based primarily on a combined sewage and storm water runoff system. More recently, installation of divided drainage is promoted with secondary sewage treatment being performed by activated sludge, which is not less costly but whose result and activity are dependent on biochemical reactions. The biochemical oxygen demand capacity fluctuates largely due to rainfall-runoff relationships though seasonal differences should be considered as well as the change of water quality by rain and toxic material infiltration. In the activated sludge process, the biological phase is complex, and the sludge recycling system further complicates the behavior of the sludge. The structure of a process simulator, the unit calculation program, and a centralized sewage and monitoring and control system are presented. The centralized control system has a capacity for security control, optimum control, and a man-machine communication. (Sandoski-FIRL)

DESIGN AND OPERATION OF A FEEDLOT RUNOFF TREATMENT SYSTEM,
University of Nebraska, Lincoln Department of Civil Engineering.
D. S. Backer.
MS Thesis, 1973, 46 p, 10 fig, 9 tab, 34 ref.

Descriptors: *Waste water treatment, *Runoff, *Feed lots, *Design, Operation and maintenance, Equipment, Costs, Automation, Odor, Aeration, Chemical oxygen demand, Suspended solids, Effluent, Hydrogen ion concentration, Analysis, Farm wastes.

This study dealt with the design, start up, and operation of a pilot plant built to treat feedlot runoff. The plant's purpose was to provide a system which was substantially automatic and economical in operation. The plant was evaluated for simplicity of construction, ease of operation and maintenance, cost of operation, effectiveness of treatment, and comparability to the laboratory unit. The design of the pilot plant was based on an aerobic unit that featured an air lift pump to return solids to the aeration chamber. Laboratory analyses were run on pH, chemical oxygen demand, and suspended solids. COD and suspended solids removals increased with increased detention time. The unit operated in the pH range 6.5-8.5. The net cost per animal was approximately $.60 for the experimental system. The field unit was easy to construct, required very little maintenance and was simple to operate. BASIC PERFORMANCE PARAMETERS FOR OXYGENATION AND LIQUID CIRCULATION IN ROTOR-AERATED LIQUID WASTE SYSTEMS,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
G. L. Nelson, J. J. Kolega, U. Agena, Q. Graves, and G. Hoffman.
Presented at 1968 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, Dec 10-13, 1968, American Society of Agricultural Engineers, St. Joseph, Michigan. Paper No 68-932, 41 p, 15 fig, 5 tab, 17 ref.

Descriptors: *Rotors, *Performance, *Liquid wastes, Equations, Livestock, Farm wastes, Waste water treatment.
Identifiers: Rotor-aerated tank, Oxygen transfer, Liquid circulation.

A study was made of performance characteristics of rotor-aerated ditch or tank systems for livestock wastes. The purpose was to: (1) identify the physical parameters that characterize oxygen transfer and liquid circulation effects in a rotor-aerated liquid waste system; and (2) based on these parameters, to develop prediction equations for oxygen transfer and for liquid circulation effects for one class of rotors. The study included experiments with two laboratory models, one each for oxygenation and liquid circulation. Conclusions include: (1) For a class of rotors, the dimensionless oxygen transfer parameter can be predicted for system design and operating purposes, (2) the oxygen transfer coefficients, km, of two geometrically similar rotors are directly proportional to the ratios of the products. (3) liquid velocity for rotor-driven circulation in a ditch can be estimated, (4) the ratio of channel length to width is non-critical in the range 5.8 to 10.0, and (5) the rotor Froude number is critical below a value of 0.15 for liquid circulation effects in a rotor-driven ditch. (Camerob-East Central Oklahoma State)

THESE STOCKYARDS' SOLUTIONS COULD WORK FOR YOU.
Feedlot Management, Vol 15, No 5, p 48-52, May, 1973. 3 fig.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Livestock, *Farm wastes, *Feed lots, *Management, Waste treatment, Waste disposal, Lagoons, Incineration.
Identifiers: *Stockyards.

A tour of several livestock markets turned up a number of methods for successfully handling livestock wastes. These techniques might be adaptable to feedlot operations. Features that will make waste removal faster and more efficient include a flow- through alley system, new concrete floors to replace brick floors, and steel pens instead of wooden ones. Most large markets are successfully meeting the challenge of controlling pollution. Major remodeling programs, and such new concepts as lagoon systems, disposal districts, and incinerators require large financial expenditures. (Cartmell-East Central Oklahoma State)

FARMLAND FARM STRESSES NO RUNOFF, LATEST TEST RESULTS.
Feedstuffs, Vol 46, No 50, p 13, December 9, 1974. 6 fig.

Descriptors: *Agricultural runoff, *Livestock, *Experimental farms, Research and development, Ditches.
Identifiers: Oxidation ditches, Waste handling.

At Farmland Industries new research and demonstration farm, there is no runoff of livestock wastes into nearby ditches or creeks. Located at Piper City, Kansas, the farm is fully self-contained. Oxidation ditches and aerobic bacteria solve the manure handling problems in the swine, poultry and dairy units. The research farm includes a swine unit, consisting of farrowing house, nursery, finishing house and gestation barn. The poultry unit has a capacity of 4,400 layer hens in two houses. It is environmentally controlled and the cages are over an oxidation ditch. The beef cattle unit has a 300-head capacity. The 20 pens of cattle also serve as test groups of feed formulations or comparisons of competitive brands. Other facilities on the farm include a feed mill, a stable for 6 horses, a show arena, a necropsy unit with laboratory and post-mortem facilities, and a waste research facility for studying new and improved methods of animal waste disposal. The work at Farmland is closely coordinated to make test results most meaningful to co-op members in their own farming and ranching. (Cameron-East Central Oklahoma State)

REMOVAL OF PHOSPHATES AND METALS FROM SEWAGE SLUDGES,
Waterloo Univ. (Ontario). Dept. of Chemical Engineering.
D. S. Scott, and H. Horlings.
Environmental Science and Technology, Vol 9, No 9, p 849-855, September, 1975. 5 fig, 7 tab, 11 ref.

Descriptors: *Heavy metals, *Iron, *Aluminum, *Zinc, *Pollutants, Sewage treatment, Sewage sludge, Phosphates, Chemical precipitation, Separation techniques, Hydrogen ion concentration, Acid-base equilibrium, Reclamation, Recycling, Solubility, *Sludge treatment, Waste water treatment, Sludge.
Identifiers: *Metal extraction, Fractionation, Selective precipitation.

The sludges produced from wastewater treatment plants contain most of the phosphate and metallic cations present in the water being treated. A technique is presented to remove these materials from the sludge with a high yield so that crude metal-phosphate products can be recovered and recycled. Iron, aluminum, zinc, and phosphate are the major elements recovered. Anaerobic sludge underflow and a filter cake produced from an anaerobic sludge were extracted in an acid mixture and the extract filtered. Metal ion and phosphate ion precipitation was carried out by slow addition of either a sodium hydroxide or a calcium hydroxide solution, with continuous stirring and monitoring of the pH. Graphs show the degree of extraction of metals and phosphate under various acid conditions and their sequence of precipitation as the extract pH is adjusted. (Davis-Vanderbilt)

REMOVAL OF DISSOLVED MOLYBDENUM FROM WASTEWATERS BY PRECIPITATES OF FERRIC IRON,
Colorado Univ., Boulder. Dept. of Geological Sciences.
G. R. LeGendre, and D. D. Rennells.
Environmental Science and Technology, Vol 9, No 8, p 744-749, August, 1975, 6 fig, 2 tab, 35 ref.

Descriptors: *Heavy metals, *Iron, *Iron compounds, *Molybdenum, *Chemical precipitation, *Waste water treatment, Adsorption, Mine water, Iron oxides, Toxicity, Effluents, Sediments, Hydrogen ion concentration, Streams, Spectrophotometry, Filtration, Colorado.
Identifiers: *Flocculant hydroxides, *Climax molybdenum mine, *Atomic absorption, *Open pit copper mines, Uranium mills, Clear creek, Ten mile creek(Colo).

A method was developed to remove dissolved molybdenum from aqueous effluents. In the presence of ferric hydroxide at a low pH, more than 95% of total dissolved molybdenum was removed from each of three mill waters tested. The ratio of dissolved ferric iron to dissolved molybdenum must exceed about 10:1 for best results. Under these conditions adsorption or coprecipitation occurs, although the exact mechanism is not completely understood. A field example is given, taking place in a stream in Colorado that receives dissolved molybdenum from a mining and milling operation. Filtration studies using a 0.01-micron filter show that molybdenum cannot be removed by filtration unless it has first been precipitated as described above. Graphs and tables show removal of molybdenum as a function of pH and amount of ferric iron present. Molybdenum was measured using a modified colorimetric thiocyanate procedure. Iron was measured by atomic absorption. (Davis-Vanderbilt)

*Biological treatment, *Oxidation, Industr
wastes, Domestic wastes, Activated carbo
Hydrogen in concentration
Identifiers: Fuller's earth.

An improvement in the process of continuou
purifuing waste water is described. It is compris
of the following steps: contacting in a treatme
zone a mixture of waste water which has a pH
between about 4 and 11 and which optionally h
been subjected to primary treatment to remo
solids, and biologically active solids in an amou
sufficient to provide a total suspended solids co
tent of the mixture of between about 10 and 50,0
parts per million; mixing a gas containing molec
lar oxygen through the mixture; and removing t
mixture from the treatment zone. The improv
ment consists of adding to the mixture betwe
about 50 and 1500 parts of activated carbon
between about 250 and 2500 parts of adsorpti
fuller's earth per million parts of feed waste wat
The carbon or fuller's earth should have a surfa
area of at least 100 square meters per gram and
particle size such that it will pass through a 2
mesh per inch sieve. (Sinha-OEIS)

cial Gazette of the United States Patent Offic
Vol 938, No 2, p 766-767, September 9, 1975.

Descriptors: *Patents, *Waste water treatme
*Water purification, *Water pollution contr
*Water quality control, *Industrial waste
*Sewage treatment, *Oxidation, Ozone, Flotatio
Identifiers: Cyanide.

A method and apparatus are described which ut
ize an ozone containing atmosphere for the oxid
tion of waste materials. The water containi
waste is propelled in a chamber in the form
small droplets into an ozone containing
mosphere with at least some of the droplets hitti
the walls of the chamber. The droplets which h
the chamber walls form a thin film on the walls a
run down to the body of water. The droplet si
should be such that a majority of the droplets w
not remain suspended in the atmosphere to form
humid atmosphere but will fall back to the body
water so that purified water is returning contin
ously to the body of water. A suitable range
droplet size is from about 5 to about 50 micron
This preconditioned liquid is picked up and e
posed to a fresh ozone atmosphere in a seconda
and subsequent chamber arranged in series. Th
number of succeeding chambers depends on th
degree of contamination of the liquid. In anothe
aspect of the invention a method and apparatu
referred to as an electric coagulator is provided f
continuously removing matter from water by flot
tion. The water containing suspended matter
subjected to electrolysis, thereby producin
hydrogen bubbles, which ascend to the surface
the water carrying the suspended matter where
can be removed. (Sinha-OEIS)

ETHOD AND APPARATUS FOR PURIFYING ASTE WATER,
Minegishi.
S. Patent No 3,905,890, 5 p, 6 fig, 9 ref; Official zette of the United States Patent Office, Vol 3, No 3, p 1230, September 16, 1975.

scriptors: *Patents, *Waste water treatment, dustrial wastes, *Water purification, *Water ality control, *Water pollution control, lectrolysis, *Flocculation, Coagulation, Electdes, Separation techniques.

nethod of purifying waste water comprises out electrolysis of water in a defined area of a ves- in order to form oxygen and hydrogen. A flow waste water is directed into the electrolysis area subject it to the influence of the newly formed ygen and hydrogen to cause promotion of nuclei mation. This causes a bonding coagulation of waste material around the nuclei. Included is a sel having an inner wall with an overflow for water and for flocculated waste which is ected into a separating chamber for the removal the solid waste material. The vessel includes a tral tubular conduit having spaced electrodes ich are subjected to a DC potential in order to duce electrolysis. After coagulation the waste terial and remaining liquid are discharged into liquid of the vessel and permitted to float to the which includes an overflow portion for the aration of the purified liquid from the floccud material. The vessel includes a filter at its tom for the passage of filtered liquid. (Sinha-IS)

THOD OF WASTEWATER TREATMENT,
otrol Corp., Milwaukee, Wis. (assignee).
N. Torpey.
S. Patent No 3,905,899, 4 p, 5 fig, 2 ref; Official zette of the United States Patent Office, Vol , No 3, p 1233, September 16, 1975.

criptors: *Patents, *Wastewater treatment, wage treatment, *Water pollution treatment, ater pollution control, *Biological treatment, aration techniques, Settling basins, degradation, Equipment.

An improved wastewater treatment tank employs a biological treatment zone, including rotating biological contactors in its upper portion and a settling zone for solid materials sloughed off the contactors and present in the wastewater in its lower portion. The settling zone is beneath the biological contactors and is physically separated from the biological treatment zone by a longitudinal baffle with forms a 'false bottom'' for the biological treatment zone. The longitudinal baffle extends the full width of the tank. Wastewater entering the treatment tank is forced through the biological treatment zone aided by the pumping effect of the rotating contactors. Rotating the contactors results in carrying forward any solids settled out of the wastewater in the biological treatment zone, thereby preventing solid buildup. (Sinha-OEIS)

EXPERIMENTAL EUTROPHICATION OF TERRESTRIAL AND AQUATIC ECOSYSTEMS. FIRST ANNUAL REPORT OF THE UPLAND RECHARGE PROJECT,
Brookhaven National Lab., Upton, N. Y. Biology Dept.
G. M. Woodwell, J. Ballard, M. Small, E. V. Pecan, and J. Clinton.
Report BNL 50420 (Biology and Medicine--TID-4500). February 1974. 29 p, 17 fig, 11 tab, 10 ref, 3 append. AEC AT(30-1)16.

Descriptors: *Sewage treatment, *Vegetation, *Nutrient removal, Recharge, New York, Marshes, Ponds, Water reuse, Observation wells, Agriculture, Grasslands, Nutrients, Groundwater, Forests, Irrigation.
Identifiers: *Brookhaven(N.Y.), Nutrient recycling, Terrestrial systems, Aquatic systems.

The alternatives to dumping nutrient-laden freshwater into coastal oceans by using natural or manmade ecosystems dominated by higher plants to reclaim water and trap nutrients in forms that may provide recycling loops to civilization were explored. Groundwater quality in the experimental test plots varied and was correlated with vegetation. The highest quality was associated with undisturbed forest. Nitrogen and calcium concentrations tended to be high under agricultural fields, lower under old fields and pine forests, and lowest under late successional oak-pine forests. After sewage was applied to those ecosystems for six months, through fall and winter, iron and phosphorus were totally absorbed in the biota and soil and sulfur and magnesium were partially absorbed. The absorption capacity of potassium and calcium was progressively reduced and sodium and chloride were not absorbed. Nitrate nitrogen rose from September-December in percolate of oak-pine forest treated with primary effluent, but reached a maximum on November 1 in the forest treated with secondary effluent. In aquatic systems, meadows functioned effectively during winter to reduce sewage organic content and specific conductance. Behavior of these systems through the year were to be investigated in the spring and summer of 1974. Combined aquatic and terrestrial systems will probably be most effective. (Buchanan-Davidson--Wisconsin)

DEVELOPMENT DOCUMENT FOR EFFLUENT LIMITATIONS GUIDELINES AND NEW SOURCE PERFORMANCE STANDARDS FOR THE MAJOR INORGANIC PRODUCTS SEGMENT OF THE INORGANIC CHEMICALS MANUFACTURING POINT SOURCE CATEGORY,
Environmental Protection Agency, Washington, D.C. Effluent Guidelines Div.
E. E. Martin.
Avialable from the National Technical Information Service, Springfield, Va 22161, as PB-238 611, 10.50 in paper copy, $2.25 in microfiche. EPA Report 440/1-74-077-a, March, 1974. 369 p, 83 fig, 85 ref, 78 tab. 68-01-1513.

Descriptors: *Chemical industry, *Waste water treatment, *Inorganic compounds, *Water quality standards, Water pollution control, Industrial wastes, Wastes, Water pollution sources, Calcium chloride, Chlorine, Calcium hydroxide, Potassium, Sodium chloride, Sodium hydroxide, Sodium sulfate, Water quality, Standards, Ecnomics, Chemicals, Effluents, Regulation, Sulfur compounds, Calcium compounds, Sodium compounds, Potassium compounds.
Identifiers: Aluminum chloride, Aluminum sulfate, Calcium carbide, Hydrochloric acid, Hydrofluoric acid, Calcium oxide, Potassium chromate, Potassium hydroxide, Potassium sulfate, Sodium carbonate, Sodium silicate, Sulfuric acid, Titanium dioxide, Aluminum compounds.

An extensive study of the inorganic chemicals manufacturing industry led to the development of effluent limitation guidelines and standards. The effluent limitation guidelines presented set forth the degree of effluent reduction attainable through the application of the best practicable control technology currently available and the degree of effluent reduction attainable through the application of the best available technology economically achievable. The guidelines cover effluents produced during the manufacture of aluminum chloride, aluminum sulfate, calcium carbide, calcium chloride, chlorine, hydrochloric acid, hydrogen peroxide, hydrofluoric acid, calcium oxide and calcium hydroxide, nitric acid, potassium chromates, potassium hydroxide, potassium metal, potassium sulfate, sodium bicarbonate, sodium carbonate (soda ash), sodium chloride, sodium dichromate, sodium hydroxide, sodium metal, sodium silicate, sodium sulfate, sodium sulfite, sulfric acid, and titanium dioxide. Based on the application of the best practicable technology currently available, 12 of the chemicals can be manufactured with no discharge of waste water pollutants while 20 of the chemicals can be manufactured without discharge of pollutants through application of the best available technology economically achievable. Supporting data and rationale for development of the effluent limitation guidelines and standards of performance are discussed. Chemical manufacturing processes, wastes, and waste treatment processes and costs are described. (Witt-IPC)

LIBRARY U. OF I. URBANA-CHAMPAIGN

costs, Recirculated water, Recycling, Separation techniques, Filtration, Aeration, Biological treatment, Regulation.
Identifiers: *Meat packing industry, *Slaughterhouse wastes, Packaging.

The results of an extensive study of the meat packing industry for the purpose of developing effluent limitation guidelines and standards for the industry are presented. Only red meat slaughterhouses (packinghouses) were included in this study. Plants that only process meat but do no on-site slaughtering, rendering operations carrried out off the site of the packing plant, and all poultry (white meat) processing plants were not included. Effluent guidelines are set forth for the degree of effluent reduction attainable through the application of the best practicable control technology currently available, and the best avialable technology economically achievable, which must be achieved by July 1, 1977, and July 1, 1983, respectively. The proposed recommendations require the best biological treatment technology currently available for discharge into navigable water bodies by 1977. The technology is represented by anaerobic plus aerated plus aerobic lagoons with efficient solid-liquid separation, or their equivalent. The recommendation for 1983 calls for the best biological, chemical and/or physical treatment and in-plant controls. In this instance, efficient biological treatment is complemented by water conservation practices, improved nutrient removal, and water filtration. When suitable land is avialable, land disposal may be an economical option to eliminate any direct direct discharge. Recycle or reuse of effluents in the plant is another alternative. Processes, wastes, and waste treatment processes and their costs are discussed. (Witt-IPC)

DEVELOPMENT DOCUMENT FOR EFFLUENT LIMITATIONS GUIDELINES AND NEW SOURCE PERFORMANCE STANDARDS FOR THE TEXTILE MILLS POINT SOURCE CATEGORY,
Enivronmental Protection Agency, Washington, D.C. Effluent Guidelines Div.
J. D. Gallup.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-238 832, $8.00 in paper copy, $2.25 in microfiche. EPA Report 440/1-74-022-a, June, 1974. 255 p, 20 fig, 216 ref, 31 tab. 68-01-1515.

Descriptors: *Industrial wastes, *Waste water treatment, *Textiles, *Water quality standards, Water pollution treatment, Wastes, Water pollution sources, Water pollution, Water pollution control, Water quality control, Waste treatment, Costs, Operating costs, Capital costs, Cotton, Suspended solids, Effluents, Filtration, Biological treatment, Coagulation, Regulation.
Identifiers: *Textile industry, Wool, Synthetic fibers.

The findings of a study of the textile industry for the purpose of developing waste water effluent limitations cover cotton, wool, and synthetic fabric and fiber finishing. Effluent limitation guidelines are set forth for the degree of effluent reduction attainable through the application of the best practicable control technology currently available and the best available technology economically achievable. The proposed regulations require in-plant waste management and operating methods, together with the best secondary biological treatment technology currently available for discharge into navigable water bodies. This technology is represented by preliminary screening, primary treatment (wool scouring only), coagulation (carpet mills only), and secondary biological treatment. In addition, multimedia filtration or its equivalent for the control of total suspended solids is recommended for new plants. Supporting data and rationale for development of the proposed effluent guidelines and standards are included. Processing techniques, wastes, and waste treatment processes and costs are discussed (Witt-IPC)

PROMISING TECHNOLOGIES FOR TREA MENT OF HAZARDOUS WASTES,
National Environmental Research Center, Cinci nati, Ohio.
R. E. Landreth, and C. J. Rogers.
Available from the National Technical Inform tion Service, Springfield, Va 22161, as PB-238 14 $4.00 in paper copy, $2.25 in microfiche. EPA R port 670/2-74-088, November, 1974. 45 p, 6 fig, ref.

Descriptors: *Waste water treatment, *Industri wastes, *Toxicity, Wastes, Water pollutio sources, Water pollution treatment, Heavy meta Organic compounds, Acids, Alkalis(Bases), Sol wastes, Liquid wastes, Pesticides, Biologic treatment, Ion exchange, Microwaves, Radiatio Osmosis, Activated carbon, Adsorption, Wat pollution control, Waste treatment, Hazard Chlorination, Chlorine, Catalysts, Oxidatio Biodegradation.
Identifiers: *Ultrafiltration.

Numerous toxic and hazardous wastes are bei generated and improperly treated and disposed by industrial sources. This study was undertak to identify and recommend promising treatme technologies for these wastes. Literature searche site visits, and personal communications with e perts in the field provided the basis for identifyi needed treatment technologies. Most hazardo waste streams are mixtures of pesticides, heav metals, organic solvents, acids, or bases, and ha a high solids concentration. Treatment process that appar applicable for processing ho homogeneous and heterogeneous hazardous was streams include chemical, biological, and physic treatments. Recommended promising techniqu for treating hazardous waste streams inclu chlorinolysis, decomposition by acids, and base chemical oxidation, biological degradation, catal sis, ion-exchange, photochemical processing, lo temperature microwave radiation, osm sis/ultrafiltration, and activated carbon adsor tion. Descriptors: *Pesticides, *Reverse osmosis, Membrane processes, Separation techniques, Pollutants, Water pollution sources, Waste water treatment, Chlorinated hydrocarbon pesticides, Organophosphorus pesticides, Organic pesticides, Water quality control, Membranes, Water pollution treatment.
Identifiers: Cellulose acetate, Polyethylenimine.

Two types of reverse osmosis membranes, i.e., cellulose acetate and cross-linked polyethylenimine (designated NS-100 by the Office of Saline Water), were evaluated for efficiency of removal of a wide variety of pesticides, including chlorinated hydrocarbons, organophosphorus, and miscellaneous pesticides. With each membrane the rejection of pesticides was better than 99%. A considerable amount of pesticide was adsorbed onto the membrane materials. The extent of adsorption is governed by van der Waals-London forces and hydrophobic bonding between pesticide molecules and the polymeric membrane materials. Membrane rejection of the pesticides is in turn governed by the polarity of the solute molecules in aqueous solution, which is in accord with the theory advanced by Sourirajan. (Witt-IPC)

BASICS OF POLLUTION CONTROL.
Gurnham and Associates, Inc., Chicago, Ill.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-238 512, $4.00 in paper copy, $2.25 in microfiche. Gurnham and Associates, Inc., Chicago, Ill., (1973). 44 p, 1 append.

Descriptors: *Dairy industry, *Water pollution sources, *Pollutant identification, Water pollution, Wastes, Industrial wastes, Wisconsin, Pollutants, Farm wastes, Waste water(Pollution), Surveys, Flow measurement, Analytical techniques, Equipment, Sampling, Water analysis.
Identifiers: Seminars.

This text outlines the technical measurements used by pollution control technologists, as they apply to the dairy industry, and defines the technical terms used in federal, state, and local laws controlling waste water discharges from dairies. Sources of water borne wastes from dairies are listed, and the significance, loadings, and limitations for each and methods of analysis are described. A program for conducting a plant waste water survey, for the purpose of determining specific sources of pollution and measuring the quantities of each, is outlined. The appendix is a paper (by C. F. Gurnham and M. I. Beach) that explains the devices and techniques used for measuring flows and for sampling waste water streams. (Witt-IPC)

BIOLOGICAL TREATMENT OF SHIPBOARD SANITARY WASTE WATER,
Merchant Marine Academy, Kings Point, N.Y.
W. H. Bailey.
Available from the National Technical Information Service, Springfield, Va 22161, as COM-75-10178, December, 1974. 71 p, 16 fig, 33 ref, 13 tab.

Descriptors: *Sewage treatment, *Biological treatment, *Ships, Water pollution sources, Waste water treatment, Water pollution treatment, Water pollution control, Water pollution, Waste treatment, Sewage, Water purification, Domestic wastes, Legislation, Waste disposal, Inland waterways, Sea water, Filters.
Identifiers: *Shipboard sewage treatment, Rotating-Disc Bio-Surf process, Klock submerged filter process.

The biological treatment of shipboard waste water and the pollution problems caused by this waste water are discussed. The study evaluates two of the most efficient biological sanitary waste water treatment systems adaptable for shipboard use, namely, the Rotating Disc Bio-Surf process and the Klock Submerged Filter process. These processes are most advantageous from a cost/benefit point of view, as opposed to purely mechanical/chemical units. The Bio-Surf system consists of a large number of plastic disks, which are mounted on a horizontal shaft and rotated while approximately one-half their surface areas are submerged in the waste water. In rotation, the disks carry a layer of waste water into the air where it trickles down the surface of the disks and absorbs oxygen. In the Klock process, waste water is circulated through the culture-laden growth medium in a baffled tank arrangement making repeated and intimate contact with large portions of the biological material. The biological treatment of wastes, composition of sewage, and regulations covering the disposal of shipboard wastes, and the problem of waste disposal from boats navigating inland waterways are considered. EFFICIENCY OF OIL SPILL REMOVERS,
P. Michel.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-237 900-T, $4.00 in paper copy, $2.25 in microfiche. English translation of Revue des Travaux de Institut des Peches Maritimes, Vol 36, No 1, p 85-102, 1972. 13 fig, 11 ref, 3 tab.

Descriptors: *Oil spills, *Water pollution sources, Disaster, Oil pollution, Water pollution control, Water pollution, Efficiencies, Oil, Translations, Foreign research, Chemical precipitation, Emulsifiers, Surfactants, Europe, Organic compounds, Marine bacteria, Toxicity, Aquatic microorganisms.
Identifiers: France.

The results of a study comparing the efficiency of 3 types of chemicals (emulsifiers, agglomerants, and precipitants) in cleaning up oil spills on water are presented. The study was carried out in the laboratory, using standard methods, in order to obtain accurate and reproducible results. Emulsifiers (based on organic solvents) and surface-active agents convert the oil into a fine emulsion; degradation of the oil by marine bacteria follows. Agglomerants are low-density powders that absorb the hydrocarbons and facilitate their recovery, while precipitants, which are also absorbent powders but heavier than water, cause the oil to settle on the sea bottom. Of the three types of agents, emulsifiers are the easiest to use. They can be used with equal ease on the high seas or in protected areas, on floating oil, or on beaches. Only their toxicity can hamper their use when marine flora and fauna must be protected. (Witt-IPC)
W76-01232

AN INTEGRATED POWER PROCESS MODEL OF WATER USE AND WASTEWATER TREATMENT IN AMMONIA PRODUCTION,
Houston Univ., Houston, Tex.
J. A. Calloway, A. K. Schwartz, Jr., and R. G. Thompson.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-237 219 $5.00 in paper copy, $2.25 in microfiche. Report NSF-RA-E-74-007, February, 1974. 91 p, 11 fig, 20 ref, 8 tab. NSF GI 34459.

Descriptors: *Ammonia, *Waste water treatment, *Water utilization, *Chemical wastes, Linear programming, Model studies, Water supply, Water resources, Energy, Texas, New Jersey, Michigan, California, Dissolved solids, Suspended solids, Heat, Injection wells, Evaporation, Ultimate disposal, Pollution taxes(Charges), Computer programs, Water consumption(Except consumptive use), Water quality standards, Water quality, Economics, Industrial wastes, Costs.
Identifiers: Zero discharge.

A linear programming model has been developed for evaluating the effects of increasingly restrictive waste water standards and higher costs of water withdrawals on production costs, effluent taxes, water use, and energy use in a representative ammonia plant. Specific cities were chosen to represent regions and the prevailing design parameters applicable to the respective cities were used in model development. The cities chosen include Houston, Texas; Trenton, N.J.; Saginaw, Michigan; and Sacramento, California. The following results were obtained: Zero discharges of suspended soids, heat, and total dissolved solids increased production costs by approximately 1.5% using injection wells for ultimate disposal and 3.2% using evaporative disposal techniques; zero discharges increased energy consumption by approximately 2.7%; higher costs for water withdrawals do not significantly increase production costs; effluent taxes required to achieved zero discharge vary with geographic region, ranging from 20 cents/lb for Saginaw, to 36 cents/lb for Trenton; and a water withdrawal price greater than 50 cents/million gallons is necessary before air cooling becomes feasible in any location. The model applies to new large plants rather than existing facilities. A description of the ammonia production process using both natural gas and naphtha feedstocks is given. (Witt-IPC)

EXPERIMENTAL PROTOTYPE OILY WASTE-WATER TREATMENT SYSTEM.
Holt (Ben) Co., Pasadena, Calif.
Available fom the National Technical Information Service, Springfield, Va 22161, as AD/A-004 990, $4.50 in paper copy, $2.25 in microfiche. March, 1974. 63 p, 20 fig, 7 tab. N62399-74-C-0004.

Descriptors: *Oily water, *Waste water treatment, *Treatment facilities, Water pollution sources, Water pollution treatment, Water pollution control, Separation techniques, Activated carbon, Organic compounds, Emulsions, Oil pollution, Water pollution, Oil, Oil wastes, Wastes, Waste treatment, Prototypes, Equipment.

An experimental prototype oily waste water treatment system rated at 20 gpm consists of three stages: a parallel corrugated plate gravity separator, a coalescer with prestrainer and prefilter, and two carbon columns for removing oil from mechanical emulsions in water of varying salinity. The first two stages will normally be employed to remove free and mechanically emulsified oil from the waste water, and the third stage will be employed only when soluble organics are present in the waste stream, or when the second stage is producing an effluent containing more than 10 ppm of hydrocarbon. TREATMENT OF WASTE WATERS FROM A COMBINED SEWER SYSTEM (EGYESITETT RENDSZERU CSATORNAHALOZAT SZENNYVIZEINEK TISZTITASA),
A. Dekei, S. Jakab, and E. Stricker.
Hidrologiai Kozlony, Vol 52, No 11, p 467-476, November 1972. 9 fig, 4 tab.

Descriptors: *Waste water treatment, *Treatment facilities, *Combined sewers, Runoff, Activated sludge, Effluents, Aeration, Sludge disposal, Sewage treatment, Anaerobic digestion, Centrifugation, Incineration.
Identifiers: Hungary, Anaerobic fermentation, Dry weather-flow.

Planning and design of a combined sewage and waste water treatment facility for a 12.7 sq km urban watershed in Hungary required a maximum yield of 9 cu m/sec as the recipient has a water yield of 0.55 cu m/sec and the dry weather waste water runoff flows at 0.60 cu m/sec. Mixed sewage water with a maximum yield of 1.5 m/sec will be treated in an activated sludge facility, while the remainder, generated during rainfall periods, will be stored for subsequent purification. Effluents exceeding a yield of 9 cu m/sec will be discharged directly to the receiving body, with the duration of such events not to exceed 3.1 hours per year. The waste water treatment plant, originally designed for a capacity of 30,000 cu m/day, will reduce the BOD5 content from 35--500 to 25 mg/liter. Vertical shaft aerators will be used and the aeration time will be 4.3 hours. The sludge obtained will be concentrated from 5 to 30-35 percent by two-stage anaerobic fermentation over 33 days. Centrifugal dehydration with polymer addition, followed by incineration in a rotary furnace, is one option being considered for sludge destruction. (Sandoski-Firl)

A SURVEY OF THE MAEBASHI MUNICIPAL SEWAGE TREATMENT PLANT INSTALLATION (MAEBASHI-SHI GESUI SHORIYO NO SHISETSU GAIYO),
S. Nakashima.
Gesuido Kyokai-shi, Vol 10, No 105, p 44-49, February, 1973. 2 fig, 3 tab.

Descriptors: *Treatment facilities, *Waste water treatment, Activated sludge, Aeration, Sewage, Incineration, Settling basins, Chlorination, Sludge disposal.
Identifiers: Maebashi Municipal Sewage Treatment Plant(Japan).

The construction of the Maebashi Municipal Sewage Treatment Plant was started in 1962 and with gradual expansion and remodeling plans due to increased population, was completed in 1972, except for the sludge incineration process. The plant requires further augmentation and remodeling due to increased total area and population beyond the projected estimations. A standard activated sludge process, convertible to the step method using high speed aeration precipitation, and combined sewer drainage can treat 60,786 cu m/day on dry days, and 165,780 cu m/day during rain. The sewage BOD is 200 mg/liter with an elimination rate of 90 percent; suspended solids are 250 mg/liter with 80 percent elimination. The treatment plant comprises a sedimentation pond, the main pump, and the first settling basin. The surface loads are 44.4 and 121.1 cu m/day with settling times of 0.7 and 0.6 hours for dry and wet days respectively. The aeration tank is divided by porous walls into six chambers, with an air stirring device on one side of the wall. Complete mixing and aeration are completed in the six chambers and the sewage is sent to the final settling basin. The median adjustment wall in this basin helps the precipitation of activated sludge. The settling time is two hours after which sewage goes to a chlorine mixing pond. The sludge goes to the treatment plant, is dehydrated by a centrifugal machine, incinerated, and buried. (Sandoski-FIRL)
W76-01278

TREATMENT IN MUNICIPAL PLANTS: INNOVATIONS FOR REMOVAL OF PHOSPHORUS,
Toronto Univ., (Ontario).
P. H. Jones.
Water Research, Vol 7, No 1-2, p 211-226, January/February, 1973. 5 fig, 2 tab, 13 ref.

Descriptors. *Waste water treatment, *Treatment facilities, Activated sludge, Sludge, Phosphorus, Nutrient removal, Chemical oxygen demand
Identifiers: Phosphorus removal, Anaerobic holding, COD removal.

The concept of removing phosphorus from waste water by using a sub-stream within the plant which naturally has phosphorus concentrated considerably above the ambient concentration has been investigated. A continuous laboratory-scale plant was studied, operating under contact stabilization conditions and using an anaerobic holding technique on the return activated sludge; phosphorus was removed from the supernatant of the return sludge stream. The plant was operated with and without the anaerobic holding modification. Both before and after the modification, the organic carbon as measured by COD removal was of the order of 90 percent; after modification of the plant to release the phosphorus from the return sludge stream, phosphorus removals jumped from 10 to 30 percent up to a high of 75 to 90 percent removal. A very slight decrease in sludge activity could be observed due to anaerobic holding, but the very slight reduction in COD removal was more than offset by the increased removal of soluble phosphorus through the supernatant of the return sludge line. (Sandoski-FIRL)

USING INTERMEDIATE STORM-WATER RETENTION TANKS (RUEB) INSTEAD OF RAIN OUTLETS (RUE) AT SUBSEQUENT ENLARGEMENT OF RATE OF FLOW OR OF MIXING RATE (DIE ZWISCHENSCHALTUNG VON REGENUEBER-LAUFBECKEN (RUEB) ANSTELLE VON REGENUEBERLAEUFEN (RUE) BEI NACHTRAEGLICHER VERGROESSERUNG DER WASSERMENGE ODER DES MISCHVERHAELTNISSES),
R. Lautrich.
Wasser und Boden, No 2, p 41-43, 1973. 2 fig, 2 ref.

Descriptors: *Data processing, *Sewage, *Waste water treatment, Storm water, Rainfall, Industrial wastes, Flow.
Identifiers: Retention tanks, Sewage load.

An electronic data processing program providing for the computation of sewage load to the main canal during one rainfall and during one year is presented. Parameters taken into consideration included: in- and out-flow times within one settlement area between a sequence of storm water retention tanks; flow detention; annual precipitation and rainfall frequency; intermittent additional water inflow; distribution of sewage water accumulation satisfying local conditions; industrial waste water inflow dependent on various fluctuations; and the settling effect of the storm water retention tanks as affected by water detention time. In addition, BOD5 computation is included in this program. Results from evaluation indicate that the total annual main canal sewage load can be reduced by applying a series of intermediate retention tanks, sized with the account of different settling times. THE EFFICIENCY OF IMMERSED TRICKLING FILTER PLANTS IN THE PRACTICE (DIE LEISTUNG VON TAUCHTROPFKOERPERANLAGEN IN DER PRAXIS),
Kh. Krauth, and K. F. Staab.
Gas und Wasserfach, Wasser/Abwasser, Vol 114, No 1, p 34-39, 1973. 5 fig, 9 tab, 4 ref.

Descriptors: *Waste water treatment, *Trickling filters, Investigations, Treatment facilities, Sewage treatment, Digestion tanks.

Information on the procedures and results of a series of 14 investigations conducted during 1969 through 1971 at main collector sewage treatment

plants and house facilities with digestion tanks are detailed. Sewage was sampled proportionally with the water quantity from the intake at the immersed trickling filters and from the drainage. The analysis was carried out for the consumption of KMnO4, BOD5, total phosphorus, total nitrogen, and for the oxidized nitrogen in the drain. The relationship between the surface load and the cleaning rate was studied, and in evaluating the data obtained, the pretreatment of the sewage was taken into consideration to prevent misinterpretation. Data indicate that concentration in a drain of equal or less than 25 mg BOD5/liter can be obtained when the load is equal or less than 10 grams BOD5/sq m per day. Also if 90 percent of all the values cannot exceed a drain concentration of equal or less than 25 mg BOD5/liter, then the surface load cannot exceed 3.0 to 4.0 grams BOD5/sq m xd. (Sandoski-FIRL)

WASTE WATER QUANTITIES, TREATMENT AND REMOVAL IN COMMUNITIES AND INDUSTRIES IN THE FEDERAL REPUBLIC OF GERMANY (ABWASSER-ANFALL, BEHANDLING AND BESEITIGUNG IN GEMEINDEN UND INDUSTRIEBETRIEBEN IN DER BRD).
Staedtehygiene, Vol 24, No 1, p 12-15, 1973. 1 tab.

Descriptors: *Waste water treatment, *Treatment facilities, Biological treatment, Cities, Rural areas, Sewage, Sewerage, Population, Industrial wastes.
Identifiers: Germany.

In the Federal Republic of Germany, 17.5 million cubic meters of waste water are drained daily to the public sewer, of which 49.8 percent is domestic and commercial, and 36.9 percent industrial waste water. Prior to discharge, 47.4 percent of the waste water is treated in biological treatment plants and 8.4 percent, undergoes mechanical treatment. Presently, many small communities do not have sewage and/or waste water treatment; in major cities about one third of the waste water quantity is treated biologically and about 40 percent treated mechanically. In the future, the sewer system in the rural regions will be completed, similar to that in cities with more than 100,000 inhabitants in which more than 90 percent of the population is connected to sewers. It is projected that from 1969 to 1985 domestic waste water quantities will increase from 8.7 to 14.7 million cu m/day. This translates to new biological treatment facilities for 9.6 million inhabitants in addition to the mechanical and partly biological treatment plants already planned or in use for 18.1 million people. KINETIC MODELING OF AERATION BASINS,
Texas Univ. at Austin. Dept. of Chemical Engineering.
F. de Villaret, and D. M. Himmelblau.
Journal Water Pollution Control Federation, Vol 45, No 2, p 292-303, February, 1973. 13 fig, 1 tab, 8 ref.

Descriptors: *Model studies, *Waste water treatment, Aeration, Biological treatment, Treatment facilities, Mathematical models.
Identifiers: Aeration basins, Microbial population.

Aeration basins are widely used in secondary waste water treatment and can usually be represented by some type of mathematical model. This study, concerned with the representation and interpretation of the kinetic portion of models of aeration basins, uses a somewhat different approach to the modeling of the biological reactions in that it accounts for the individual components of the substrate but treats the microbial population as a homogeneous mass. Validity of the proposed treatment has been demonstrated by experimentation in both batch and continuous laboratory aeration tanks. In view of the need for control and analysis in biological waste water treatment plants, it is beneficial that the kinetic coefficients of the process model be obtained from such laboratory systems. When introduced into models of the waste water treatment process together with mixing or dispersion parameters obtained in the plant on the actual equipment, predictions for plant operation and design can be made. The models represent not only steady-state operation but also transient responses caused by changes in plant loading and process upsets. (Sandoski-FIRL)

AERATED LAGOONS PROVIDE EFFECTIVE TERTIARY TREATMENT,
Itasca, Ill.
J. J. Kindermann.
Public Works, Vol 104, No 3, p 97-98, March, 1973. 4 fig.

Descriptors: *Aerated lagoons, *Waste water treatment, *Tertiary treatment, Activated sludge, Sewage, Sludge disposal, Aeration, Biochemical oxygen demand, Flow, Illinois.
Identifiers: Itasca(Ill), Settling tanks, Vacuum filters.

Completed in 1969, aerated lagoons supplement a conventional activated sludge plant in Itasca, Illinois and this arrangement has avoided several potential problems. The city of 5000 has a present average dry-weather flow in the sewer system of about 0.5 mgd. The activated sludge plant consists of four primary settling tanks, two aeration tanks, a final settling tank, and a sludge disposal system consisting of a holding tank and a vacuum filter for dewatering the sludge. Aeration is provided by the valved tubing arrangement laid transversely to form 290 lines, with the distances between lines increasing with distance from the inlet. With air rising laminarily from the tubing, it creates linear 'air screens', separating the lagoons into treatment cells. Four blowers are provided, two rated at 15 hp each to deliver 230 cfm of air at 10 psi, and two rated at 5 hp each to deliver 80 cfm at 9 psi. These are used alternately as 20-hp pairs furnishing 310 cfm. The lagoons were sized to accept a daily BOD loading of 562 pounds. The sides are sloped on a ratio of 1 to 4.17. The retention period at design average flow is 1.9 days. (Sandoski-FIRL)

THE SEWERS OF PARIS (LES EGOUTS DE PARIS),
Paris (France).
M. Ganneau.
Travaux, No 455, p 40-45, February, 1973. 8 fig.

Descriptors: *Sewers, *Treatment facilities, *Sewerage, Siphons, Storm runoff, Combined sewers, Water supply.
Identifiers: Paris, France, Gravity sewers.

Through the sewers of Paris, effluents are channeled by five gravitational collectors, with slopes of 0.20 m/km, into waste treatment plants located in the north and northwest from Paris. When necessary, the collectors are conducted underneath the Seine bed by means of siphons. High storm water runoff loads occurring in the mixed sewage system are leveled off by retention basins. The sewage system also accommodates water supply pipes, telephone and other communication lines. (Sandoski-FIRL)

FACTORS AFFECTING ADOPTION OF LAND TREATMENT OF MUNICIPAL WASTE WATER,
North Carolina State Univ. at Raleigh. Dept. of Economics and Business.
G. A. Carlson, and C. E. Young.
Water Resources Research, Vol 11, No 5, p 616-620, October 1975. 1 fig, 3 tab, 6 equ, 21 ref.

Descriptors: *Waste water treatment, *Water pollution control, *Regression analysis, Land, Technology, *Economics, Municipal wastes, Data collections, Demand, Prices, Decision making, Probability, Constraints, River flow, Rainfall, Labor, Capital, Irrigation water, Volume, Mathematical models, Systems analysis, Estimating, Equations.
Identifiers: *Land treatment, Nonlinear regression, Demand curve, Empirical analysis, Log linear, Linear model, Federal funding, Byproduct production, Sales.

A demand curve for land treatment of municipal waste water is derived assuming a profit-maximizing framework. The outputs of a waste treatment facility are taken to be volume of waste water, degree of waste removal, and potentially marketable by-product. The demand curve for land treatment is estimated by utilizing data collected from 125 U. S. cities. The dependent variable is adoption or nonadoption of land treatment, and coefficients are estimated by nonlinear regression. The price of byproducts (water), required degree of treatment, price of capital, and local construction cost share all significantly increase adoption. Volume of river flow, rainfall, and volume of effluent flow all have a significant negative effect on adoption. Land prices were insignificant, a factor which is believed to be due to the nonpurchase of land by many land treatment facilities. (Bell-Cornell)

WATER REUSE: A FLEXIBLE AND EFFICIENT MANAGEMENT ALTERNATIVE FOR MUNICIPAL WATER SUPPLY,
Butler Univ., Indianapolis, Ind. Holcomb Research Inst.
D. M. Dworkin.
Water Resources Research, Vol 11, No 5, p 607-615, October 1975. 6 fig, 8 tab, 19 ref.

Descriptors: *Water supply development, *Water reuse, *Simulation analysis, *Water management(Applied), *Alternative planning, Municipal water, Reservoirs, Streamflow, Economics, Economic efficiency, Costs, Effluents, Water utilization, Mathematical models, Systems analysis, Water quality control, Colorado.
Identifiers: *Colorado Springs(Colo), Program expansion.

There is an increased interest in water reuse to supplement present supplies or to be incorporated in future plans, due to the decreasing availability of conventional sources, the better-quality effluent being discharged under stricter pollution control regulations, and the federal legislation requiring the consideration of reuse as an alternative water supply source. Herein, a comparison between the fixed schedule of planned expansion of water supply sources and an alternative expansion program based on a short-term decision from monitoring reservoir levels, water use, and streamflows and employing water reuse capacity and new source development is simulated for the Colorado Springs municipal water system. For this complex, fast growing system with supply based on streamflows and some current reuse capacity, the alternative plan postpones major new development an average of 14 years at a cost at present value of half the original planned expansion; the alternative is more efficient since (1) it would allow demands on the system to rise without increasing conventional capacity and (2) it could substitute for high levels of assurance. A minimum requirement of present planning for renovation or reuse of water is the modification of systems to include a physical cross connection between the two, allowing water to be used interchangebly for nonpotable purposes, and a common management process to make such decisions. (Bell-Cornell)

NOW, NO ODOR WASTE HANDLING,
R. J. Fee.
Successful Farming, Vol 71, No 9, p K14, August, 1973. 2 fig.

Descriptors: *Odor, *Waste treatment, *Hogs, *Farm wastes, Centrifugal pumps, Sewage, Costs, Effluents, *Iowa.
Identifiers: Pits.

A new concept in odorless waste handling for hogs is being used on the Orville Luedtke farm in Iowa. The basic principal of the Rem-Ox system is that its uses atmospheric oxygen to maintain an aerobic condition in the waste for fast, odor free organic material digestion. All waste treatment is done within the building, using centrifugal force, circulating sewage pumps to agitate and aerate the material in the pits. The 'racetrack design' pits in the Luedtke's system can be much more shallow than usual. The centrifugal force sewage pumps are placed at strategic locations to propel the effluent in a circular fashion around the building. Costs depends on the size and type of structure. Sizing of pumps and motors is based primarily on the daily animal manure input into the system. (Cameron-East Central Oklahoma State)

THE HIGH COST OF RUNOFF CONTROLS: IS HELP NEEDED.
The Furrow, p 14-15. March, 1975.

Descriptors: *Costs, *Agricultural runoff, *Control systems, *Feed lots, Livestock, *Cost sharing, Farm wastes, Water pollution control, *Waste treatment.
Identifiers: Rural Economic Assistance Program.

New state and federal laws governing runoff control from feedlots will be costly for all livestock producers and may force the smaller ones out of business. Michigan State University economists estimate that runoff controls would costs from $3.98 to $14.37 per head for feedlots with 1,000 head or more, and they could run higher for smaller operations. USDA economists estimate control costs for northern areas could costs $25 per head for a 150-cow dairy and more for smaller dairies. The USDA approved a cost-sharing program (REAP) in 1973 which enabled a producer to receive up to 80 percent of the total costs for runoff controls with a maximum of $2,500. The $2,500 ceiling on funds provides little relief for the impact of control costs of large feedlot operations; however, large operations can pass these costs on to consumers more easily than smaller operations. Cost sharing programs for 1975 are questionable because there were no cost-sharing programs in 1974. (Battles-East Central Oklahoma State)

THE ANAEROBIC DIGESTION OF WASTE FROM AN INTENSIVE PIG UNIT,
Rowett Research Inst., Bucksburn (Scotland).
P. N. Hobson, and B. G. Shaw.
Water Research, Vol 7, No 3, p 437-449, 1973. 1 fig, 13 tab, 14 ref.

Descriptors: *Anaerobic digestion, *Waste treatment, *Hogs, *Farm wastes.
Identifiers: *Loading rates.

Anaerobic digestion was investigated as a primary treatment for very strong agricultural wastes, to reduce the solids and polluting properties and to improve the settling of the waste in order to give a supernatant liquid which, while not up to river board standards would be suitable for discharge to town sewers, for secondary aerobic or other treatment, or for recycling as animal house washwater. Six experiments were run. Experiments 1 and 2 concerned batch digestion of waste. The experiments showed that a proper digestion, with the primary acidic and secondary methanogenic fermentation in balance, could not be developed by direct incubation of undiluted or almost undiluted, pig waste. Experiment 3 showed that a balanced digestion of piggery waste could be obtained using a seed of digesting sewage, but that loading rate in the early stages of the digestion could be a critical factor. Experiment 4 showed that a balanced digestion of piggery waste could be achieved without a seed if the initial loading rate was low enough to allow a methanogenic flora to develop before a high acid concentration was reached. Experiments 5 and 6 dealt with performance of initially seeded and unseeded digestions at different loading rates. These two experiments revealed that balanced digestion could be obtained by using, initially, low loading rates and allowing time for the build-up of a stable population of the correct bacteria. THERMOPHILIC BACTERIAL OXIDATION OF HIGHLY CONCENTRATED SUBSTRATES,
Stuttgart Univ. (West Germany). Institut fuer Siedlungswasserbau und Wasserguetewirtschaft.
F. Popel, and C. H. Ohnmacht.
Water Research, Vol 6, p 807-815, 1972. 6 fig, 3 tab, 9 ref.

Descriptors: *Thermophilic bacteria, *Farm wastes, *Oxidation, Aerobic bacteria, Sewage sludge, *Waste treatment.
Identifiers: Mesophilic bacteria, Pasteurization, Substrates.

Disposal of substrates with high amounts of pathogenic bacteria and oxidizable organic matter can be accomplished without polluting resources after proper stabilization, pasteurization and deodorization. This is accomplished by heating them long enough to degrade the pathogenic bacteria and organic matter. The heat is provided by exothermic reactions in aeration tanks to which the sludge has been added. The sludge must be continually recirculated to aid mesophilic and/or thermophilic bacteria and to provide an oxygen balance in the circulating liquid. Exothermic reactions heat the substrates up to 65-70 degrees centigrade which accelerates the rate of degradation of the organic matter and pasteurization of the substrates. Also large quantities of humus compounds are produced during the oxidation. This process can be used on highly concentrated substrates with a high BOD5 such as sewage sludge, liquid manure from animals, or industrial waste. (Russell-East Central Oklahoma State)

TROUT METABOLISM CHARACTERISTICS AND THE RATIONAL DESIGN OF NITRIFICATION FACILITIES FOR WATER REUSE IN HATCHERIES,
Texas Univ. at Austin. Dept. of Civil Engineering.
R. E. Speece.
Transactions of the American Fisheries Society, Vol 102, No 2, p 323-334, April 1973. 14 fig, 12 ref.

Descriptors: *Trout, *Metabolism, Data collections, *Nitrification, *Water reuse, *Fish hatcheries, Oxygen requirements, Ammonia, Suspended solids, Temperature, Feeding rates, Biochemical oxygen demand, Water pollution effects, Treatment facilities.
Identifiers: Nomograph.

An attempt is made to bring together the available information on trout metabolism and nitrification with the objective of establishing a rational procedure for the design of nitrification facilities for water reuse in trout hatcheries. The same rationale can be used for other types of fish through the use of the appropriate ammonia production, oxygen requirement, and water requirement data. Data have been taken from the literature on trout culture to mathematically define the ammonia production, oxygen requirements, BOD and SS production, water requirements, and loading rates as a function of trout length and water temperature. The temperature dependence of feeding rate and nitrification capacity has been incorporated into a nomograph which predicts the nitrification volume requirements for recycling. Another nomograph was constructed to predict water flow requirements and pollution resulting from trout hatchery operation. (Cartmell-East Central Oklahoma State)

CONFINEMENT LIVESTOCK FACILITIES WASTE MANAGEMENT CODE OF PRACTICE.
Alberta Environment. Edmonton, Alberta, Canada, September 1973, 31 p, 7 fig, 4 tab.

Descriptors: *Canada, *Confinement pens, *Farm management, Design, Odor, Livestock, Farm wastes, Treatment facilities, Waste treatment.
Identifiers: Isolation distances, Waste handling, Land application, Alberta.

Public concern about all forms of pollution of the environment is growing while intensive livestock operations are increasing in number and size. The number of residential dwellings on or near farmland is increasing. Developers of non-agricultural activities in agricultural areas should be aware that complete odor control is beyond present technical capabilities. These guidelines stress that when conflicts result from encroachment on agricultural areas, much of the responsibility should be accepted by the developers and not only the agricultural operator. Guidelines for confinement livestock facilities waste management intend to provide a technical base upon which livestock

peration can develop without causing undue en-ironmental impact. Administration and defini-ons regarding the guidelines are given. The iidelines are defined in terms of developments quiring compliance and the isolation distances. he various components of design guidelines for vestock facilities are listed and examined. The mponents include manure storage, earthen itch basins (and alternate methods), walled orage, storage lagoons and mechanically aerated stems. The guidelines for animal waste manage-ent, including the handling of solid and liquid anure, are discussed. Land application is also ex-nined. Directions for the procedure for using the de are given. (Kehl-East Central Oklahoma tate)

entifiers: *Environmental impact statements, Mangrove swamps, Gulf Stream.

he project, an ocean outfall of secondarily eated sewage into the ocean off Southeast orida, calls for a 50 mgd outflow of sewage into e Gulf Stream which would probably be insuffi-ent to disperse the materials from Florida aches or dilute them to insignificant levels. otential negative effects of continued presence of trients, viruses and poisons present in the ef-ent include the danger to public health of re-dents of Palm Beach, Broward, and Dade Coun-s, primarily through direct viral infection and duced availability of uncontaminated fresh ater. Commercial and recreational use of the fshore waters might be reduced due to fish kills, increase in presence of blue-green algae which ers coral reef vitality, damage to fishing and urist interests due to poisoned shellfish, shrimp d fish caught near outflows, as well as increases mangrove swamp pests. The Environmental otection Agency (EPA) and the governments of est Palm Beach and other local communities pport the proposals as safe techniques affording e best available technical solution to segage sposal. A second related group recognizes the ngers of ocean outfall but continues to prefer it a solution. Environmentalists, academic representatives and professional consultants tend to form a third group, which proposes alternatives to the ocean outfall in order to recover highly purified fresh water, safeguard resident health and minimize damage to ocean inhabitants, sport and commercial fishing and recreation. POLLUTION OF RECIPIENTS BY STORM RUNOFF IN MIXED SEWER SYSTEMS: STORM RETENTION BASINS AS A REMEDY (LA POLLUTION DES EMISSAIRES PAR LES DEVERSEMENTS DES RESEAUX UNITARIES: UN REMEDE LES BASSINS D'ORAGE),
Y. Carre.
Techniques et Sciences Municipales--LEau, Vol 70, No 7, p 313-317, July, 1975. 7 fig, 6 tab, 14 ref.

Descriptors: *Storm runoff, *Sewerage, *Retention, Biological treatment, Waste water treatment, Water pollution sources, Biochemical oxygen demand, Water pollution control, Rain water, Combined sewers.
Identifiers: Retention basins, Baden-Wuerttemberg(Germany).

A method for the control of the pollution of recipients by storm runoff in combined sewer systems in Baden-Wuerttemberg, Germany, is discussed. The BOD content and the pollutant load were measured. It was determined that the storm runoff, especially that discharged during the initial phase of rain, is often as polluted as the effluents that occur during dry weather. Therefore, retention of the initial runoff in retention basins for subsequent biological in-plant treatment is necessary. Storm runoff retention basins have been designed to retain 90% of the annual BOD5 content in the Baden-Wuerttemberg area. (Takacs-FIRL)

HOW MANY WASTEWATER TREATMENT PLANTS ARE NECESSARY IN REGIONAL SEWER SYSTEMS. (HANY SZENNYVIZTISZTITO TELEP LEGYEN A REGIONALIS CAATORNAERNDSZEBEN).
A. Toth, and L. Bulkai.
Hidrologiai Kozlony, Vol 55, No 4, p 164-167, April, 1975. 1 fig, 1 tab.

Descriptors: Sewerage, *Waste water treatment, *Treatment facilities, Regional development, Costs, Biological treatment, Waste disposal, Irrigation, Lakes.
Identifiers: Lake Balaton(Hungary), Sewer pipes.

Economic and technological optimization of regional sewer systems and waste water treatment plants is described, based on optimization calculations for the regional sewer system planned for Lake Balaton in Hungary. The costs of regional sewer systems are composed of sewer and treatment plant costs. Increasing the number of waste water treatment plants in regional systems reduces the cost of the sewer system, as it becomes possible to reduce the diameter of the long-distance sewer pipes. The specific costs per cubic meter of treated waste water depend primarily upon the required degree of purification. Optimization calculations revealed the need for five mechanical waste water treatment plants for the Lake Balaton regional system when using the waste water for irrigation after settling for two hours. This optimum may be reduced to two to three plants if biological treatment is applied before discharge into recipients. One or two large-capacity treatment plants with three steps will be required for purification if the purified water is to be discharged into the lake. (Takacs-FIRL)

SEWAGE AERATION TURBINE.
South African Patent ZA 7305-730. Issued February 21, 1975. Derwent French Patents Abstracts, Vol W, No 22, p D1, July, 1975.

Descriptors: *Patents, *Aeration, *Sewage treatment, Equipment, *Waste water treatment.
Identifiers: *Aeration turbine.

A sewage aeration turbine has been patented. The device consists of an axial flow impeller, designed to rotate below the surface of a liquid body; and a drive mechanism coupled to the impeller to rotate it. The impeller includes several radially extending propeller blades. At least some of these are hollow and have one or more openings which permit the passage of gas into the liquid from the interior of the hollow blades. Equipment located above the liquid surface communicates with the interior of the hollow blades to deliver the gas. Thus, the gas flows out the openings in the blades as the blades rotate to impel the liquid. (Kramer-FIRL)

POLLUTED WASTE WATER PURIFICATION.
Soviet Patent SU 437719. Issued January 3, 1975. Soviet Inventions Illustrated, Vol W, No 24, p D1-D2, July 22, 1975.

Descriptors: **Patents, *Waste water treatment, *Biological treatment, *Sewage treatment, Aeration, Tanks, Reservoirs, Water reuse.
Identifiers: Municipal-industrial wastes.

A patent was issued for a method of waste water purification in which only the most contaminated part of the effluent is treated. Surface waste water from populated and industrial areas was collected. The water received during the first 20 to 30 minutes (the most heavily contaminated) was separated for biological treatment with municipal sewage in an aeration tank. The remaining water was aerated in a periodically emptied tank. In one case, the initial amount of waste water was allowed to settle before being mixed with municipal water for biological purification. The remaining collected surface waste water was aerated in the presence of activator or treated waste water from the first portion. Following disinfection, the water could be reused for industrial or domestic purposes. (Kramer-FIRL)

PROCESS AND APPARATUS FOR TREATING WASTES BY A COMBINED ACTIVATED SLUDGE AND BIOLOGICAL FILTER BED,
J. Tymoszczuk.
Canadian Patent 972,877. Issued August 12, 1975. Patent Office Record, Vol 103, No 32, p 84, August, 1975.

Descriptors: *Patents, *Activated sludge, *Filters, *Waste water treatment, Sewage treatment, Biological treatment, Equipment, Filtration.
Identifiers: *Biological filters.

A patent has been granted to a process and equipment for treating wastes by a combined activated sludge and biological filter bed. Sewage is treated in a tank containing the means to maintain a submerged biological filter bed zone containing finely divided, particulate filter media. The tank further contains equipment to maintain an activated sludge zone in the tank in an upstream fluid flow relationship to the submerged biological filter bed zone. Baffles divide the tank into several compartments. These baffles extend through the activated sludge zone and partially into the biological filter bed zone. When the apparatus is in use, the finely divided particulate filter media can be recirculated and backwashed and the activated sludge zone aerated. Sewage is fed into the first compartment and treated effluent is removed from the activated sludge zone of the last compartment. (Kramer-FIRL)

CONTINUOUS FILTRATION APPARATUS FOR SEWAGE.
French Patent FR 2247-270. Issued June 13, 1975. Derwent French Patents Abstracts, Vol W, No 29, p D2-D3, August, 1975.

Descriptors: *Patents, *Filtration, *Sewage treatment, Tanks, *Waste water treatment, Pumps, Equipment, Filters, Separation techniques.
Identifiers: Continuous filtration.

A cylindrical filter tank, covered with a filtering fabric, is arranged in a reservoir. In this patented method, sewage enters the chamber of the reservoir through an inlet pipe. A cylindrical supporting plate surrounds the filtration tank, and another cylindrical support plate is arranged inside the chamber. Sewage water flows up the passage and through the filter into the space. Air enters through openings and generates a flow of bubbles; this produces a pressure difference between the fluid containing bubbles and the fluid without bubbles. The pressure difference removes the solid matter adhering to the filtering fabric and prevents clogging. An overflow pipe then receives the filtered water. Any small particles which pass through the filter are evacuated from the conical portion by an air pump. Concentrated solid matter and residue from the sewage is evacuated for further treatment. Because the flow of bubbles prevents any blocking of the filter fabric, removal of the suspended solid matter is efficient and continuous filtration is possible. (Kramer-FIRL)

WASTE WATER AND SEWAGE PURIFICATION APPARATUS.
Belgian Patent BE 825-764. Issued June 16, 1975. Derwent Belgian Patents Report, Vol W, No 28, p D3, August. 1975.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, Activated sludge, Biological treatment, Aeration, Sedimentation.
Identifiers: *Chemical treatment.

An apparatus for treating waste water and sewage which can be installed inside an aeration tank was patented. It operates either by the activated sludge process or by chemical purification with air or an oxidizing gas. A flat supporting surface carries the air feeding device and a discharge gutter. The latter is parallel or vertical with respect to the support, depending upon whether the shape of the tank is rectangular or cylindrical. The air feed consists of an extensible tube provided with porous aerators. Air is received which sufficiently aerates the contents of an activation zone and recycles any settled sludge out of a reclarification zone. At the same time, floating sludge is evacuated from the surface of the latter zone. The gutter has a terminal oblique plate, which is swept by the air leaving the inlet device so that a suction effect is created to draw the floating sludge from the reclarification zone to the activation zone. This equipment is particularly suitable for small sewage treatment plants with tanks made of metal, plastic, asbestos cement, or concrete. (Kramer-FIRL)

THE UNOX PROCESS--AN EXTENSIVE EXPERIMENT FOR THE BIOLOGICAL PURIFICATION WITH PURE OXYGEN-- MUNICIPAL WATER PURIFICATION MUNICH (DAS UNOX VERFAHREN--EIN GROSSVERSUCH ZUR BIOLOGISCHEN ABWASSERREINIGUNG MIT REINEM SAUERSTOFF--STADWAESSERUNG MUENCHEN),
P. Martin, H. Schoenfelder, and W. Tischer.
Gas-und Wasserfach-Wasser/Abwasser, Vol 116, No 6, p 272-277, 1975. 7 fig, 1 tab.

Descriptors: *Biological treatment, *Waste water treatment, *Municipal wastes, Industrial wastes, Effluents, Oxygen.
Identifiers: *High purity oxygen, *UNOX, Municipal-industrial wastes.

Extensive experiments with the UNOX system developed by Union Carbide for biological waste water treatment are described. The waste water used for the experiments was comprised of 60% domestic effluents with 40% effluents generated in food processing industries. The UNOX system is composed of closed reactors arranged in four stages, in which biological purification is achieved by the admission of air containing at least 95% oxygen. The purified effluent was of better quality than similar effluents treated by conventional methods for the same time period. The process was noted for its high stability with respect to load fluctuations, and a reduced production of excess sludge and solid matter. The UNOX system also offers hygienic advantages due to a reduction in air pollutant emissions. (Takacs-FIRL)

DEVELOPMENT OF THE DEEP AERATION TANK, (IN JAPANESE),
H. K. Fujii, K. Terasawa, I. Naito, and T. Takeshima.
Gesuido Kyokaishi, (Journal of Japan Sewage Works Association), Vol 12, No 133, p 43-52, June, 1975. 6 fig, 6 tab, 6 ref.

Descriptors: *Aeration, *Tanks, *Suspended solids, *Waste water treatment, Gas chromatography, Activated sludge, Flotation.
Identifiers: *Deep aeration tanks.

A deep aeration tank with an aeration depth of 18 m was compared with one having an aeration depth of 4.2 m. An inner 1.0 m in diameter was used for liquid circulation for the latter case utilizing an air lift effect. The post aeration tanks consisted of four basins having an aeration depth of 4.5 m (water depth 5 m). Mixed liquid was sampled in glass cylinders after one hour of aeration and the liquid was allowed to stand for various periods of time. At an aeration depth of 4.2 m, the activated sludge in the mixed liquid settled almost completely after 30 minutes while at an aeration depth of 18 m, the activated floated during the same period of time. The rate of flotation depended upon the quantities of activated sludge and air. Gases adsorbed on the floating sludge were analyzed by gas chromatography with a thermal conductivity detector. The gases contained up to 94% nitrogen. Good results were obtained at an aeration depth of 4.2 m for a BOD load of up to 100 kg/100 kg suspended solids per day. (Su-FIRL)

CENTRIFUGING PLANT IN THE PURIFICATION PLANT MUNICH-GROSSLAPPEN (ZENTRIFUGENLAGE IM KLAERWERK MUENCHEN-GROSSLAPPEN),
W. Tischer.
Abwassertechnik, Vol 26, No 3, p 23-24, 1975. 1 fig, 1 tab

Descriptors: *Centrifugation, *Dewatering, *Sludge treatment, *Waste water treatment, Treatment facilities, Polymers, Flocculation, Sludge disposal, Waste disposal.
Identifiers: Munich(Germany)

Full-scale experiments with a large-capacity Klioeckner-Humboldt-Deutz centrifuge used for sludge dewatering at the Grosslappen waste water treatment plant near Munich, Germany, are described. The existing digestors cannot cope with the 200 tons of primary and secondary sludge that are being generated daily. The demand for agricultural use of the sludge has decreased and the use of centrifuges for dewatering is a viable alternative to land application. With centrifugation, the dry matter content is increased from 3-10% to 20-30%. The water separated has a BOD5 level of 100-300 mg/liter. Flocculating polymers may be added directly into the centriguge. (Takacs-FIRL)

PURIFICATION OF URBAN WASTEWATERS BY ALKALINE PHYSICO-CHEMICAL TREATMENT (L'EPURATION DES EAUX RESIDUAIRES URBAINES PAR TRAITEMENT PHYSICO-CHIMIQUE ALCALIN),
D. Alexandre.
Techniques et Sciences Municipales--L'Eau, No 6, p 239-247, 1975. 1 fig, 11 tab, 6 ref.

Descriptors: *Waste water treatment, *Municipal wastes, Flocculation, Biochemical oxygen demand, Chemical oxygen demand, Operating costs, Capital costs, Waste disposal.
Identifiers: *Physico-chemical treatment, Aluminum sulfate, Ferric chloride, Slaked lime, Polyacrylamide A22, Land application.

Alkaline physico-chemical waste water treatment and its advantages are described. Flocculation and subsequent clarification can be used as an autonomous process in place of biological waste water treatment. Flocculation is conducted at a pH of 11.5 in the presence of ferric chloride, aluminum sulfate, slaked lime, or polyelectrolytes. Aluminum sulfate, ferric chloride, slaked lime, polyacrylamide A22 (Purifloc), and powdered activated charcoal Acticarbone TE are used at rates of 20 g/liter, 10 g/liter, 35 g/liter, one g/liter, and 1 g/liter, respectively. The floccules obtained can be easily separated by decantation, and the dense sludge obtained can be disposed of onto landfills. The physico-chemical method is not inferior to biological methods in terms of BOD and COD reduction, and is even superior to the latter regarding disinfection and phosphate elimination. Physico- chemical treatment, requiring lower investment but higher operating costs than a biological system offers the advantage of increased insensitivity to seasonal climatic and load variations. (Takacs-FIRL

lentifiers: Post-treatment lagoons, Sewage load uctuations, Seasonal variations, Germany.

perating experiences with sewage lagoons folwing biological waste water treatment at a facili in Bad Harzburg, West Germany, are resented. Four series-connected post-treatment goons with a total surface area of 23,000 sq m are ecessary to handle wide fluctuations in the wage load, which are a result of snowwater inux in the winter and an increase in the seasonal sitor population in the summer months. Water epth is adjustable between zero and 100 cm, and wage has a residence time of one day in each goon. The lagoons were found to increase the efciency of the entire biological waste water treatent plant from 97% in terms of BOD5 reduction. otassium permanganate demand decreased from to 48 mg/liter through the consecutive lagoons. OD values showed a reduction from 39 to 23 g/liter, corresponding to a 40% reduction. The fficiency of the post-treatment lagoons in terms nitrogen and phosphorus elimination amounted 17% and 10%, respectively. The coli titer was duced by 99%, and the lagoons had a healthy sh population. (Takacs-FIRL)

OMPARATIVE STUDY OF POLIOVIRUS ONCENTRATION METHODS FROM WATER SSAIS COMPARATIVES DE METHODES DE ONCENTRATION DU POLIOVIRUS APARTIR ES EAUX),
Gulian, M. N. Mallet, A Blancard, and J. harrel.
echniques et Sciences Municipales--L'Eau, No p 205-208, May, 1975. 4 tab, 8 ref.

Descriptors: *Pollutant identification, *Filtration, Viruses, Organic matter, Hydrogen ion concentration, Polyelectrolytes, Separation techniques, *Waste water treatment.
Identifiers: *Poliovirus.

Two methods for the separation of poliovirus from different waste were studied. Filtration through a cellulose filter showed efficiencies of over 90% for waste waters with low organic matter content. However, very low efficiency was achieved for waste waters with a high content of organic substances. Adsorption of a polyelectrolyte PE 60 (polystyrene-divinylbenzene with an sobutylene maleic anhydride group) proved to be highly effective with efficiencies between 90 and 100% regardless of the organic matter content of the waste water. However, this method requires a pH value of 5.2. Slight deviations from this pH value result in considerable reduction of the separation efficiency. (Takacs-FIRL)

H. Zerres, and R. Wagner.
Chemie Ingenieur Technik, Vol 47, No 13, p 562-565, 1975. 5 fig, 4 ref.

Descriptors: *Flocculation, *Phosphates, *Waste water treatment, *Nutrient removal, Measurement, Flow, Treatment facilities, Photometry. *Pollutant identification.
Identifiers: Flocculant dosage, Phosphate removal.

A method for determining phosphate load-dependent dosage of flocculants for phosphorus removal from municipal waste water is described. The dosage is dependent on the fluctuations in the phosphate load of the waste water. This method is based upon the continuous photometric measurement of the phosphorus concentration in the waste water by a molybdate-vanadate method, and on the measurement of the waste water flow. The signal obtained is used to control the rotation speed of the flocculant proportioning unit, and thus to determine the actual phosphate load. This method has been successfully tested a a waste water treatment plant. (Takacs-FIRL)

STUDY OF THE RELATIONSHIP BETWEEN EFFICACY OF PURIFICATION AND CONSTRUCTION AND OPERATING COSTS OF PURIFICATION PLANTS (UNTERSUCHUNG UEBER DIE BEZIEHUNG ZWISCHEN RENINGUNGSGRAD UND BAU UND BETRIEBSKOSTEN VON KALERANLAGEN),
G. Heberling, and H. Hahn.
Gas-und Wasserfach-Wasser/Abwasser, Vol 116, No 5, p 206-208, May, 1975. 5 fig, 14 ref.

Descriptors: *Waste water treatment, *Operating costs, *Construction costs, *Treatment facilities, Mathematical models, Biochemical oxygen demand, Regression analysis.
Identifiers: *Germany.

Correlations between waste water purification efficiency and the construction and operating costs of waste water treatment plants were investigated. Regression analysis was performed on the basis of data from 179 waste water treatment plants put into operation between 1955 and 1972 in West Germany and elsewhere. The regression analysis showed no significant correlation between predetermined purification efficiency goal and the construction and operating costs for new waste water treatment plants. However, a close correlation was found between the expenditures and the population equivalents to be connected to the waste water treatment plant. This correlation, in conjunction with the finding that 84% of the waste water treatment plants reached BOD5 elimination efficiencies over 80%, permits the establishment of universally applicable mathematical models. THE FORECASTING, OF INFLOW VARIATION INTO THE WASTE WATER TREATMENT FACILITY IN THE NEW TOWN, (IN JAPANESE),
M. Hiraoka, T. Murakami, O. Yamamoto, and Y. Horii.
Yosui to Haisui, (Journal of Water and Waste), Vol 17, No 7, p 849-853, 1975. 8 fig, 5 tab, 4 ref.

Descriptors: *Waste water treatment, *Treatment facilities, Water supply, Inflow, Mathematical models, Flow, Forecasting.
Identifiers: *Japan, Inflow variation, Regional forecasting.

Variation of inflow of waste water to a treatment plant at Izumi Kita, Japan, was forecasted by a regional system. The relationship between water supply and waste water was investigated in order to control the waste water variation by water supply variation. Water supply and waste water showed a similar daily flow pattern; waste water had its daily peaks at 9-10 am and after 10 pm. Variation of water supply was extremely broad with a maximum supply of 2,000-2,500 cu m/h and a minimum of 200 cu m/h. Except for one case, water supply flow was considerably higher than waste water. This was due to the conservation in the activity system and transfer to outside of the regional system. Results of investigating the correlation coefficient between water supply variation and waste water variation suggested effective forecasting of inflow waste water variation by water supply variation corresponding to a lag time of about one hour. Descriptors: *Mathematical models, *Sewage treatment, *Activated sludge, Aeration, Microorganisms, Water quality control, Suspended solids, Treatment facilities, Flow rates.
Identifiers: Material balance equations, Voshel equation.

Mathematical models for sewage treatment by an activated sludge method are illustrated. The method generally consists of initial sedimentation, aeration, and final sedimentation. Water quality from the initial sedimentation can be obtained by a simple Voshel equation. For an aeration basin, water quality is obtained by resolving material balance equations involving flow rates and reactivity of water, microorganisms, substrate, and the variations in microorganism activity. Corrections of equations by using a parameter for the decreasing rate of microorganisms cultivated in synethic sewage water were found suitable for most available equations for the aeration process. Water quality can be kept at a stable level by allowing microorganisms to remain in ther aeration tank for a constant period of time. Two equations used to calculate suspended solids values for the final sedimentation tanks at two water treatment plants from 1966 to 1969 gave satisfactory results. (Su-FIRL)

CONTROL OF THE POLLUTION OF SURFACE WATER BODIES (BESTRIJDING VERONTREININGING OPPERVLAKTEWATER),
J. G. Wedorp.
Procestechniek, Vol 30, No 14, p 454-456, July, 1975.

Descriptors: *Water pollution control, *Public health, *Turbidity, Color, Odor, Surface waters, Aquatic life, Water treatment, Treatment facilities, Waste water treatment, Sewers, Sewerage, Water treatment(Applied).
Identifiers: *Netherlands.

The water pollution control program elaborated by the Ministry of Transportation and Water Management and the Ministry of Public Health and Environmental Hygiene of the Netherlands for the 1975 to 1979 period is presented. The waste water treatment capacity is to be increased to 20,000,000 population equivalents by the construction of 118 waste water treatment facilities and by the expansion of 58 existing ones. The percentage of household not connected to sewer systems will be reduced to 8%. Absence of odor, color, and turbidity are the minimum requirements for the water quality to be achieved within the five-year period. Also, any surface water body should be made suitable as a living environment for aerobic organisms, including fish. Water treatment fees to be paid will be determined as a function of transportation distance, capacity of the water treatment facility, soil conditions, and population density. (Takacs-FIRL)

FORCE MAIN RUNS OBSTACLE COURSE.
Public Works, Vol 106, No 9, p 117, September, 1975.

Descriptors: *Sewerage, *Sewers, Tunneling, Pipelines, Conduits, Steel pipes, Construction, Pumping plants.
Identifiers: *Force mains.

The construction of a force main to connect the 126th Street bus depot in Corona, Queens, to the New York City sewer system involved tunnelling under 16 active railroad tracks operated by two different companies, a railroad station, a creek, and two 13,000-volt feeder cables. A boring machine was used to drill 180 feet north to the bus depot and 220 feet south to the sewer. Depending on the type of materials encountered by the machine, progress ranged from 1-2ft/day to 30 ft/day. Twenty foot long sections of 30 inch steel pipe were forced ahead of the boring machine and joined to form a conduit for the 8 inch ductile cast iron main. The conduit is sized to be able to handle additional lines if needed in the future. After completion of the conduit and placement of the cast iron main inside, the main was attached to the casing by straps tack-welded by a man who crawled through the narrow tunnel with a supply of steel straps and welding equipment. It required five days to place 40 straps. A pump house constructed next to the bus depot provides the force necessary to move sewage through the main. The pump house contains an electrically operated duplex, vertical, submerged sewage ejector controlled by a transistorized, alternating pump panel housed in this building. (Orr-FIRL)

MIAMI SEWER PLAN TAKES THE POSITIVE APPROACH,
Miami City, Dept. of Public Works, Fla.
J. J. Kay.
Water and Wastes Engineering, Vol 12, No 9, p 31-34, 36, September, 1975. 2 fig, 2 tab.

Descriptors: *Sewers, *Waste water treatment, *Sewage treatment, Florida, Construction materials, Design criteria, Pipelines, Joints(Connections), Infiltration, Installation, Flow rates.
Identifiers: *Sanitary sewers, *Miami(Fla).

The city of Miami, Florida, has been implementing a program to provide new sanitary sewer systems and to upgrade its existing sewers. Combined sewer systems are not desirable as they place too severe a load on the sewage treatment plant during high intensity rain storms, and have very high pumping requirements and maintenance costs. Installation of sanitary sewers in South Florida depends on soil conditions, groundwater elevation, and depth of cut. In many cases, an apparatus called a 'mule' is needed in sewer construction at moderately deep cut ranges where trench sidewalls have become unstable. When a large and deep trunk line is required, a 'piggyback' sewer system is utilized, in which a minimum 8-inch diameter pipe is laid in the same trench and above the larger trunk line. Criteria for design of sanitary sewers include population density, groundwater infiltration, a minimum velocity of 2 feet per second, and an average daily flow of 65 gallons per capita per day. Infiltration problems may be alleviated with the specification that new joints for clay pipe and fittings will be factory bonded joints. Tests for leakage are performed before the acceptance of installation of new sanitary sewers. Replacement of 50 year old concrete pipes with vitrified clay pipe is also being done when major redevelopment within the public right-of-way occurs. (Kramer-FIRL)
W76-01456

SEWER LINE INFILTRATION PROBLEM SOLVED.
Consulting Engineer, Vol 45, No 3, p 96, 98, September, 1975. 4 fig.

Descriptors: *Sewers, *Infiltration, *Pipelines, Equipment, Joints(Connections), Monitoring, Control systems, Remote sensing, Interceptor sewers, Polymers, Repair, Rehabilitation.
Identifiers: *Television inspection, Grouting material.

Repair of an interceptor line laid along a lake shore in Fayetteville, North Carolina, is described. Because the eight-foot sections of concrete pipe had been laid in gravel bedding in water-bearing sand, infiltration was a severe problem. Two thirds of the line had been installed below the lake level and a continuous pressure existed on rubber compression gaskets and joints which could not be reduced by cement collars on the joints or by grouting. The infiltration problem was solved, however, with a system employing closed circuit television and an inflatable sleeve packer. The television camera was pulled through the sewer pipe, with the packer following. The packer was then positioned visually, inflated, and filled with a metered amount of 3M Elastomeric Sewer Grouting Compound and water. The grouting material was released and compacted under pressure as it expanded up to ten times to fill the area with a flexible seal. Six months following this rehabilitation treatment, weir measurements were made to determine flow rates, and it was determined that the repair effort was successful. (Kramer-FIRL)
W76-01457

GROUTING STOPS INFILTRATION IN LARGE DIAMETER STROM DRAIN.
Public Works, Vol 106, No 9, p 82, September, 1975.

Descriptors: *Infiltration, *Polymers, *Sewers, *Rehabilitation, Storm drains, Construction materials, Joints(Connection), Repairing, Pipelines, *Grouting, Louisiana.
Identifiers: Grouting material, Lake Charles(La).

Infiltration into storm sewers has been prevented by a pipe rehabilitation system, applied to Lake Charles, Louisiana. Because the sewer lines were installed about fifteen years ago directly in water-bearing sand, water and sand infiltration have been a serious problem and shifting of the line's four-foot concrete sections has cracked the masonry grout in the joints. A permanent repair method was implemented, using a new hydrophilic polymer grouting material. The system requires a three-man crew and employs a group application probe, a three element inflatable packer, and 3M Elastomeric Sewer Grouting Compound. A faulty joint may be rehabilitated by manually positioning the packer inside the pipe barrel, holding the probe at the application point, and inflating the packer's two end elements to isolate the repair area. The grouting compound is then metered and mixed with water, and injected under pressure into the space between the packer's end elements. The center element is then inflated and compacts the compound into the joint. Because the grouting compound is a low viscosity liquid which expands up to ten times, the joint is filled with a tough but flexible seal within three minutes. After one year of rehabilitation, the system was found to still be preventing infiltration. (Kramer-FIRL)

SAM: A SEWER SYSTEM MODEL FOR PUBLIC WORKS ENGINEERS,
CH2M/Hill, Corvallis, Oreg.
A. L. Davis, and W. G. O'Neel.
Public Works, Vol 106, No 10, p 78-79, 120, October, 1975, 1 tab, 2 ref.

Descriptors: *Computers, *Model studies, *Sewer systems, Design criteria, Infiltration, Storm runoff, Manholes, Flow rates, Pipelines, Simulation analysis, Oregon.
Identifiers: Portland(Ore), System Analysis Model(SAM).

A System Analysis Model (SAM) for the city of Portland, Oregon, has been designed. This computer model simulates the overloading of the city's combined storm and sanitary sewer system in order to determine where overloading would have occurred and to determine the best route of waste water through the city's sewer system. The model arrives at its conclusion by developing hydrographs and hydraulic gradelines for sewer nodes (usually manholes), by calculating sewage flow from all sources, particularly from storm runoff, and by mathematically routing the sewage through the system. SAM is also used by engineers to keep an inventory of pipe size, length and condition, manhole volume and condition, and to keep maintenance information of all the components. It also has applications in sewer design and sewer system analysis. The SAM is compatible with the Portland IBM 1130 computer, and can be used for a small amount of initial data, offering the flexibility of changing data later. The model was designed in four separate routines to permit its use with the small capacity computer. The modules are storm runoff, sanitary sewage contributions, infiltration and inflow, and routed flow in the sewers. Existing quality routines can be expanded, and SAM can estimate the pollution impact of storm overflow. The model can also be linked to another one called DEAP, which designs, estimates the costs of, and plots new sewer lines. The ultimate usage of SAM is system control, which has been tested in the municipality of Metropolitan Seattle. (Kramer-FIRL)

TREATING SEWAGE.
Australian Patent 461,647. Issued June 5, 1975. Official Journal of Patents, Trade Marks and Designs, Vol 45, No 19, p 2112, June, 1975.

Descriptors: *Patents, *Sewage treatment, Separation techniques, Equipment, Waste water treatment, Aeration, Organic matter, Tanks.

A method was patented for the removal of solids from liquid sewage. A tank is described, with a floor which ends in an accumulation zone for solids, parallel to and adjacent to a first side wall. Sewage is passed into the tank, and uniformly distributed along the first side wall which is positioned transverse to the direction of flow. Air is introduced into the sewage adjacent to the first side wall and above the accumulation zone. Thus, fluid containing light organic matter and light particles of grit of a specific gravity greater than the organic matter is forced to flow upward toward a second side wall, opposite the first wall. The wall interrupts the flow and directs it downward to the tank floor by a baffle positioned adjacent to the second wall. At least part of the sewage is passed under the baffle and upward between the baffle and the second side wall where it is removed by flow over a weir which extends the full length of the second side wall. METHOD AND APPARATUS FOR PURIFYING WASTE WATERS AND SEPARATING SLUDGE,
K. Stopka.
Canadian Patent 973,830. Issued September 2, 1975. Patent Office Record, Vol 103, No 35, p 39, September, 1975.

Descriptors: *Patents, *Waste water treatment, *Separation techniques, Sludge treatment, Effluents, Ozone.

A patent was issued for the treatment of waste water and the separation of sludge. The effluent liquid is formed into droplets in an ozone containing atmosphere. Suspended material in the water is removed by electrolyzing the water. Hydrogen gas bubbles are thereby produced, which rise to the surface of the water, carrying the suspended material to form floating sludge. The sludge is removed, leaving clarified water. WASTE TREATMENT APPARATUS,
L. R. Rosenberg.
United States Patent 3,904,525. Issued September 9, 1975. Official Gazette of the United States Patent Office, Vol 939, No 2, p 768, September, 1975. 1 fig.

Descriptors: *Patents, *Biological treatment, *Waste water treatment, Equipment, Microorganisms.
Identifiers: Biological reactors.

A patent for a biological reactor for waste treatment has been issued. Biological mass growing media is attached to the rotor of a rotating biological reactor. The media consist of a group of wedge-shaped elements, each having opposite planar major surfaces. Each of these surfaces has a pattern of protrusions and depressions, and include coacting projections and receptacles which serve as spacers to keep the elements apart from one another. Alignment means includes pockets in each of the elements and latches whereby pockets of one element align and cooperate for engagement with latches in an adjacent element. (Kramer-FIRL)

THE ROLE OF THE WISCONSIN DEPARTMENT OF AGRICULTURE IN AGRICULTURAL POLLUTION PREVENTION AND CONTROL,
Wisconsin Dept. of Agricultural, Madison.
D. E. Wilkinson.
In: Proceedings of Conference on Farm Animal Wastes, Nitrates and Phosphates, in Rural Wisconsin Ecosystems, Madison, Green Bay, and Eau Claire, Wisconsin, February 1-5, 1971, p 119-124.

Descriptors: *Wisconsin, *Environment, *Farm wastes, Regulation, Legal aspects, Waste disposal, Management, Control.
Identifiers: *Agricultural pollution, *Pollution control.

Donald Wilkinson, Secretary, Wisconsin Department of Agricultural, is optimistic about the prospects of developing a quality environment, one in which there is a high degree of compatibility between the ecological and economic community. There is an ever-increasing problem of cohabitation. The important part of this human-animal relationship is waste disposal and a clean environment. Since the total farm income in Wisconsin exceeds 1.6 billion dollars and since the livestock industry produces about 86 percent of this total, animal waste disposal is very important. The Department of Agricultural is concerned with many other types of wastes as well. Wilkinson stresses that it is foolish to think that environmental pollution can be managed by assigning agricultural waste and pollution to farmers, industrial pollution to industrialists and other types of wastes to the public in general. He feels that environmental problems will be solved only by integrated effort and coordinated management of resources at the rural-urban interface. (Cameron-East Central Oklahoma State)

ENVIRONMENTAL, ECONOMIC, AND PHYSICAL CONSIDERATIONS IN LIQUID HANDLING OF DAIRY CATTLE MANURE,
New York State Coll. of Agriculture and Life Sciences, Ithaca. Dept. of Agricultural Economics.
G. L. Casler, and E. L. LaDue.
New York's Food and Life Sciences Bulletin (Social Sciences: Agricultural Economics, No 1), No 20, 23 p. October, 1972. 10 tab, 42 ref.

Descriptors: *Dairy industry, *Cattle, *Farm wastes, *Waste storage, *Waste treatment, *Waste disposal, *Liquid wastes, Odor, Runoff, Economics, Nutrients, Costs, Storage tanks, Oxidation lagoons, Water pollution sources, Agricultural runoff, Cost-Benefit analysis.
Identifiers: Land spreading, Slatted floors, Open pits, Manure.

The environmental, economic, and physical implications of liquid manure handling for dairy cattle is considered. It was found that six months storage of liquid manure for disposal in the spring is not always beneficial. Large quantities of manure spread in the spring just before a heavy rain may cause more stream pollution than small quantities spead daily during the winter. Also, odor is more offensive in the spring. An investment of $27,000-$37,000 would be required for a 100-cow liquid manure system with a six month storage capacity.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Labor savings and increased manure value offset only a small part of the annual costs of a liquid manure system. The total return to the farm operator will rarely offset the costs incurred. Even if all costs and benefits could be internalized to the farm level costs would usually exceed benefits. (Ballard-East Central Oklahoma State)
W76-01023

FEEDLOT WASTE MANAGEMENT SYSTEMS,
R. C. Albin.
In: Proceedings of the 1970 Beef Cattle Conference, Texas Tech University Animal Science Department, Lubbock, and Texas Tech University Research Center, Pantex, October 29, 1970, p 8-17. 26 ref.

Descriptors: *Farm wastes, *Feed lots, Pollutants, Waste treatment, Waste disposal, Runoff, Aerobic conditions, Anaerobic conditions, Lagoons, Dehydration, Incineration, Recycling, Agricultural runoff, Farm management, Oxidation.
Identifiers: *Waste management systems, Land spreading, Composting, Oxidation ditches.

The rapid expansion of cattle feedlots in the U. S. created the problem of handling and disposing of a vast quantity of feedlot wastes. The chemical and pollutional characteristics of feedlot wastes vary. The type of ration, size of cattle, climate, feedlot surface, and moisture content are all important factors in developing a waste management system. Numerous handling and disposal systems such as anaerobic and aerobic systems, lagoons, composting, oxidation ditches, dehydration, incineration, and nutrient recycling are available. However, final disposal of feedlot waste has been on land in most instances. The Great Plains Agricultural Council report recommended that research efforts be intensified in the areas of air pollution, land disposal, pollution under feedyards, systems analysis, complete economic evaluation of current alternatives for waste disposal, and socio-legal implications. FEEDLOT POLLUTION,
Montana State Dept. of Health, Helena. Water Pollution Control Section.
D. G. Willems.
In: Proceedings of the Annual Agricultural Seminar Montana Agriculture-Focus on Improving the Environment, Great Falls, Montana, December 3-4, 1970, p 31-34.

Descriptors: *Feed lots, *Air pollution, *Water pollution sources, *Montana, *Regulation, *Legal aspects, *Permits, Waste disposal.
Identifiers: *Point source wastes, Land disposal.

The Montana water pollution control law prior to 1970 is delineated. Its greatest effect was upon industry and municipalities because their point source wastes were easy to identify and treat. But agricultural pollution must be met as well. Confined animal feeding drainage may well be the largest point source discharge in terms of organic material. The purpose of the proposed 1970 confined animal feeding regulation is: (1) to see that feedlot operations are properly located with respect to municipalities and residential areas, and (2) to control air and water pollution problems. The regulation would require new feedlots and expanding feedlots to secure a permit from the Department of Health as soon as the regulation is adopted. (Hisle-East Central Oklahoma State)
W76-01027

GRASS-FILTER SYSTEMS--ANOTHER NEW RUNOFF CONTROL METHOD.
Feedlot Management, Vol 15, No 5, p 42, May, 1973.

Descriptors: *Waste treatment, *Waste disposal, *Runoff, *Control, *Farm wastes, *Fescues, Aerobic conditions, Lagoons, Feed lots, Kansas, Nutrients, Soil bacteria, Agricultural runoff.
Identifiers: *Grass filter systems.

A fescue grass-filter system for absorbing and treating runoff is being tested at the 20,000 head Blackjack Feedyards, Inc. near Yates Center, Kansas. The system is based on fescue grass over which lagoon-collected runoff is sprayed irrigation-style. A buildup of soil bacteria which forms a mat on the ground digests the feedlot waste solids purifying the runoff. Mat depth must be kept at less than 1 inch at all times or the system will become anaerobic. Grass is necessary to hold the solids on the land so that the bacteria can multiply and digest the material. Fescue grass is a good choice for eastern Kansas because of its adaptability to heavy moisture. If winter icing problems and year round mat buildup can be combatted effectively, it is hoped that grass-filter systems will be an acceptable method of treating and disposing of runoff. (Cartmell-East Central Oklahoma State)
W76-01028

AREA NEEDED FOR LAND DISPOSAL OF BEEF AND SWINE WASTES,
Iowa State Univ., Ames, North-Central Regional Extension Project.
D. H. Vanderholm.
Cooperative Extension Service Publication Pm-552, Iowa State University, Ames, January, 1973, 2 p, 4 tab.

Descriptors: *Farm wastes, *Cattle, *Hogs, *Waste disposal, *Nitrogen, Phosphorus, Potassium, Formulation, Irrigation, Waste treatment, Management, Waste management, Lagoons, Mathematical analysis.
Identifiers: *Land disposal, Oxidation ditches, Deep-pit storage, Anaerobic lagoons, Bedded confinement, Open lots, Manure.

Formulas were established to determine the areas required for land disposal of hog and cattle wastes. The formulas are based upon an estimated 120 pounds of nitrogen excreted per 1000 pound-cow and 18.25 pounds per 100 pound-hog, varying with ration, breed, and size of the animal. Nitrogen losses in treatment, storage, and handling have been established for six types of management systems to arrive at recommended disposal areas based upon 100 pound Nitrogen applications per acre. Corresponding P and K rates are given. Approximate nutrient content of various farm waste forms are given. (Frantz-East Central Oklahoma State)
W76-01029

LIQUID MANURE MANAGEMENT FOR SWINE,
Texas Agricultural Extension Service, College Station.
B. R. Stewart, and J. M. Sweeten.
Agricultural Extension Service paper, June 15, 1972, 24 p, 2 fig, 5 tab, 5 ref.

Descriptors: *Liquid wastes, *Farm wastes, *Management, *Hogs, Waste storage, Waste treatment, Waste disposal, Legal aspects, Lagoons, Regulation, Runoff, Confinement pens, Rates of application, Nutrients, Irrigation, Agricultural runoff, Farm management.
Identifiers: *Manure, Land disposal, Storage pits, Slotted floors, Open pits.

Texas regulatory guidelines are stated which give minimum requirements for preventing water pollution from confined feeding operations. Treated or untreated wastes may not be discharged to water courses except under rare rainfall events, therefore, alternative measures must be used. For confinement operations, this may mean (1) daily scraping and cleaning of wastes for lagoon or pit storage, followed by land disposal, (2) use of slatted floors for collecting animal wastes in storage pits, followed by land disposal, or (3) use of slatted floors for catching animal wastes in shallow under-floor pits which discharge continuously into an outside lagoon. Pasture and open lot operations require solid waste management techniques with the exception of having to catch rainfall runoff in retention ponds. Specific design and management requirements are given for liquid waste storage, treatment, and land disposal of swine wastes. (Marquard-East Central Oklahoma State)

SOME PHYSICAL AND ECONOMIC ASPECTS OF WATER POLLUTION CONTROL FOR CATTLE FEEDLOT RUNOFF,
Texas Tech Univ., Lubbock.
T. R. Owens, D. Wells, W. Grub, R. C. Albin, and E. Coleman.
Typescript, N. D. 21 p. 9 tab.

Descriptors: *Water pollution, *Control, *Runoff, *Farm wastes, *Feed lots, *Cattle, *Economics, *Waste treatment, *Waste storage, *Waste disposal, Costs, Texas, Chemical properties, Irrigation, Basins, Model studies, Rainfall, Evaporation, Performance, Agricultural runoff.
Identifiers: Land disposal, Slotted floors, Manure, Playa lake disposal.

Quantitative and qualitative aspects of feedlot runoff are studied. Average concentrations of pollutants in feedlot runoff are determined. Collection basin designs were discussed as runoff control measures. Comparative operating and investment costs are approximated with limitations discussed. Open land disposal has been attempted but modified environmental feeding on slotted floors is recommended as an approach to the problem. Pros and cons of the latter are discussed. THEY'RE GETTING THE JUMP ON POLLUTION CONTROLS,
R. Graves, and C. Hartman.
Hoard's Dairyman, Vol 119, No 12, p 768, June 25, 1974. 1 fig.

Descriptors: *Water pollution, *Control, *Confinement pens, *Farm wastes, *Runoff, *Diversion, Dairy industry, Waste storage, Livestock, Agricultural runoff.

dentifiers: Manure, Environmental Eye Project.

armers in Lafayette County, Wisconsin, are emonstrating that they will respond to positive, ensible programs aimed at controlling pollution nd stream degradation from confinement vestock operations. With impetus provided by ie county extension office and soil and water onservation district, many groups and agencies re involved in making the 'Environmental Eye' a ommunity project. The idea behind this project egan in the spring of 1972. An environmental eye both a real thing and a 'gimmick'. Looking at a illside farmstead as an eyeball, a diversion up hill om the buildings forms and eyelash. A collection hannel or diversion below the buildings ompletes the eye. These two diversions are imortant parts of any barnyard runoff control proct. For most small yard situations, the diversion f water from above the barn prevents manure om being flushed or washed out of yards or torage areas. Rain falling directly on the yard will ash away little manure. This usually can be conrolled by directing it away from streams or itches to nearby pasture or cropland. If more conrol is necessary, a solids separation area, detenon pond, or both, can be added at the end of the ollection channel. (Cartmell-East Central klahoma State)

HE PROBLEM OF FARM ANIMAL WASTE ISPOSAL,
hio State Univ., Columbus. Dept. of Agricultural ngineering.
. P. Taiganides.
anagement of Farm Animal Wastes, roceedings National Symposium on Animal aste Management, American Society of Agricultural Engineers, Michigan State University, May -7, 1967, p 5-8, 1 tab, 10 ref.

escriptors: *Farm wastes, *Waste disposal, Livestock, *Poultry, *Confinement pens, agoons, Odor, Runoff, Water pollution, Costs, Agricultural runoff.
dentifiers: *Animal wastes, Land application.

nimal wastes are one of the six sources of farm astes whose management and disposal have ecome one of the most challenging problems of odern farming. The factors which cause and/or ggravate the animal waste disposal problem are: roperties of animal wastes, current methods of vestock and poultry production, expansion of rban centers into rural areas plus public awareess of the need for healthy and aesthetically leasant environment, and inadequacy of present ethods of manure handling and disposal. On the asis of population equivalence data reported by aiganides and Hazen (1966) the daily wastes from oultry, swine, and cattle alone are equivalent to 0 times the wastes of the human population of the nited States. American animal producers seek aste disposal methods which have low labor equirements, reduce nuisance conditions, and imrove sanitation. They are limited by lack of echnical information and by the misconception hat they should be able to dispose of manure at no xtra cost. This lack of both the basic and applied nowledge necessary for successful handling, reatment, and disposal of farm wastes makes esearch in this area a unique challenge. FIELD PERFORMANCE OF SELECTED BEEF FEEDLOT WASTE HANDLING SYSTEMS,
Illinois Univ., Urbana-Champaign.
D. H. Vanderholm, J. C. Lorimor, and S. W. Melvin.
Presented at 67th Annual Meeting, American Society of Agricultural Engineers, Oklahoma State University, Stillwater, June 23-26, 1974. Paper No 74-4015, 9 p, 5 fig, 2 tab, 2 ref.

Descriptors: *Cattle, *Farm wastes, *Management, *Feedlots, *Monitoring, *Waste storage, *Waste disposal, *Corn belt, Oxidation lagoons, Control.
Identifiers: *Pollution control, Holding ponds.

Four feedlots were selected as research and demonstration sites to study waste management alternatives in the Corn Belt. Two were unsurfaced open lots utilizing holding ponds. The other two were cold confinement slotted-floor barns, one with a conventional deep pit manure storage and one with an under-flood oxidation ditch system. No attempt was made to rate the systems relative to one another, but data and observations were intended to provide a basis for evaluating the systems individually and collectively. All of the systems described in this paper were adequate to meet current pollution control regulations when adequately sized and properly managed. (Cartmell-East Central Oklahoma State)

CATTLE FEEDLOT POLLUTION STUDY,
Texas Tech. Univ., Lubbocks. Dept. of Agronomy.
E. A. Coleman, W. Grub, R. C. Albin, G. F. Meenaghan, and D. M. Wells.
Interim Report No. 2 to Texas Water Quality Board, Texas Tech University Water Resources Center, Lubbock, Texas, April, 1971, WRC-71-2, 20 p. 8 tab.

Descriptors: *Waste treatment, *Waste disposal, *Cattle, *Feedlots, *Irrigation, *Runoff, Application rates, *Soil contamination, *Farm wastes, Salts, Cotton, Grain sorghum, Soybeans, Bermudagrass, *Agricultural runoff.

Germination studies, test plot studies, and field studies were made to determine beneficial or nonharmful rates at which runoff from cattle feedlots can be applied to growing crops. Results indicate that such runoff must be applied with caution to most crops, as it is very detrimental to the germination of most field crops in the High Plains area of West Texas and is also detrimental to seedlings in the same area. However, relatively low application rates are beneficial to mature crops at least on a short term basis. The buildup of soluble salts in the upper 30 inches of the soil profile indicates that land disposal may not be the ultimate solution to runoff disposal. (Wetherill-East Central Oklahoma State)

INCLUSION OF DRIED POULTRY WASTE AS A FEED INGREDIENT IN CATFISH RATIONS,
Texas Agricultural and Extension Service, College Station.
J. C. Fowler, and J. T. Lock.
Feedstuffs, Vol 46, No 44, p 36, October 28, 1974. 1 fig, 2 tab, 4 ref.

Descriptors: *Catfishes, *Diets, Proteins, Performance, Taste, Poultry, Farm wastes.
Identifiers: *Poultry waste.

A study was done to determine the feasibility of including air dried poultry waste as a feed ingredient in catfish rations. Air-dried manure was used in the diets at a dietary level of 25 percent. All diets were calculated to contain essentially equal amounts of crude protein assuming that the hen manure contained 21 percent protein. Catfish consuming diets containing air-dried poultry waste had better weight gain than catfish consuming the control diet over the 150 day feeding period. Taste panel evaluation of the test tissue and control tissue revealed no significant differences. (Cameron-East Central Oklahoma State)

Descriptors: *Methane, *Solid wastes, *Vegetation, *Fermentation, Methane bacteria, Algae, Water hyacinth, Kelps, Farm wastes, Grasses, Domestic wastes, Anaerobic conditions, Water pollution sources, Fueld, Gases.

The formation of methane by anaerobic fermentation of paper, grass, household garbage, freshwater algae, water hyacinth, seaweed, cattle manure, dry manure, and dry dog food, separately or in various mixtures, was studied. The fermentations were carried out in sea water as well as in freshwater and at temperatures ranging from 33 to 48C. The digesters were operated as single-stage reactors in which both the acidogenic and methanogenic bacteria are present, or as two-stage digesters in which the groups of bacteria are separated into the two tanks operating in series. The most satisfactory materials for conversion to methane were freashwater algae (Chlorella) and a marine giant kelp (Macrocystis pyrifera). Water hyacinth and common seaweed (Ascophyllum nodosum) were resistant to attack by methane-producing bacteria. Conversion of these materials was improved by pretreatment with cellulase or hot sodium hydroxide. Conversion of untreated animal waste was fairly effective, although pretreatment with hot sodium hydroxide appeared to improve conversion efficiency. Methane productivity from the two-stage digestion system was approximately equal to that from the singlestage system under essentially equivalent operating conditions. (Witt-IPC)

Descriptors: *Waste water treatment, *Sludge, *Dewatering, Treatment facilities, Pilot plants, Filters, Municipal wastes.
Identifiers: Hungary, Vacuum-drum filter.

Plans for an experimental sludge dewatering installation serving at domestic waste water treatment plants in Hungary are described. Earlier technio-economic considerations controlling the application of dewatering in Hungary are reviewed and reasons justifying the construction of the experimental installation indicated. In this context, the preparatory work preceding the designing of the experimental plant, the considerations governing the selection of the technology, and the problems which the pilot plant is expected to answer are formulated. Under the expansion program of the existing treatment plant at Szekesfehervar an experimental vacuum-drum filter will be added. Information is presented for the plant experiments envisaged, on the procedure of experimentation, and data processing. (Sandoski-FIRL)

DISPOSAL OF DOMESTIC WASTEWATER BY HILLSIDE SPRAYS,
California State Dept. of Public Health, Berkeley. Bureau of Sanitary Engineering.
E. Seep.
Journal of the Environmental Division, American Society of Civil Engineers, Vol 99, No EE2, p 109-121, April, 1973. 1 fig, 23 ref.

Descriptors: *Waste water disposal, *Spraying, Soils, Surface runoff, Design, Sewage, Effluents, California. Operation and maintenance, Land treatment.
Identifiers: Land disposal, Hillside land application.

Hillside land disposal spraying is a reliable method of domestic waste water land disposal which can be used in areas where the soils are not suitable for subsruface disposal or the terrain is too rough for the construction of evapotranspiration-percolation ponds. It is being practiced at approximately 100 camps, subdivisions, and small communities located on foothill and mountain areas throughout California. The goal of the disposal area design is to provide a system which will operate reliably with no surface runoff from the designated area. Design considerations involve: climate and hydrology; geology, soil properties, and topography; treatment capability of soil; application rates; distribution system; public health and reliability requirements; and, operation and maintenance. The principal operational aspects of the spray disposal system are as follows: records are kept of all sewage bypasses, power failures, effluent runoff, and disinfectant uses. Dosing is intermittent to maintain aerobic conditions and high infiltration rates. Spray areas are alternated to provide rest periods for breakup of biological slimes. No spraying is done on bare or disturbed soil, during rainstorms, or when the soil is saturated. No spraying is done during strong winds if the spray is carried toward nearby human habitations. Spray areas are inspected periodically for clogged sprinklers, dripping nozzles, broken pipes, leaking joints, erosion, and runoff. Spare parts should be maintained for all essential disposal functions to enable speedy repair of broken down equipment. (Sandoski-FIRL)

WET OXIDATION DISPOSAL OF WASTE MATTER IN SUSPENSION.
French Patent FR 2244-722. Issued May 23, 1975. Derwent French Patents Abstracts, Vol W, No 26, p 4, August, 1975.

Descriptors: *Waste disposal, *Oxidation, Waste water treatment, Organic matter, Biochemical oxygen demand, Chemical oxygen demand.

A reactor for wet oxidation disposal of waste matter in suspension has been patented. The reactor is essentially a horizontal, cylindrical autoclave, divided into several compartments by vertical partitions. An inlet line delivers liquid into the first of these compartments. Each compartment contains a top entry, high speed rotary shaft, with two vertically spaced agitators, and a bottom entry oxygen/air inlet nozzle. The nozzle is directed onto the underside of the lower agitator and disperses fine bubbles into the liquid. Transfer pipes aid in moving the liquid between compartments and in discharging it from the final chamber via separate vapor and liquid outlets. In the disposal of waste organic matter, BOD and COD values are reduced by 80 to 90%. Because of the intense dispersal of fine oxygenation bubbles, the process performs well at lower temperatures than previous wet oxidation processes. (Kramer-FIRL)

Vodsnabzhenie i Sanitarnaya Tekhnika, No 5, p 13-17, 1975. 2 fig, 3 tab, 6 ref.

Descriptors: *Filtration, *Water treatment, *Waste water treatment, *Industrial wastes, Municipal wastes, Flotation, Tanks, Filters, Potable water, Suspended solids.
Identifiers: Filtering materials, Polystyrene foam.

Floating filtering materials and their uses are described. Polystyrene foam and lightweight aerated granules of originally compact materials are used as floating filter materials, arranged in filter tanks in one or more layers, or at one or more (usually two) levels. Floating filtering materials can be used for the purification of industrial and municipal waste water, and for the preparation of potable water from natural water. The suspended matter content in the water to be purified should not be greater than 500 mg/liter, and the rate of filtration should be between 0.6 and 2 m/hr. The granules of the filtering material should be 0.3-1.5 mm in diameter. The combined thickness of the filtering material arranged at two levels or in two layers is optimally between 0.7 and 1.2 m. Filtration rates over 20 m/hr are possible for drinking water preparation. (Takacs-FIRL)

THE QUALITY AND TREATMENT OF ARTESIAN WATERS IN HUNGARY (A HAZAI MELYSEGI VIZEK KEZELESENEK SZUKSEGESSEGE ES TECHNOLOGIAJA),
L. Kolin.
Hidrologiai Kozlony, Vol 55, No 6, p 236-244, June, 1975. 8 fig, 2 tab, 4 ref, 8 photo.

Descriptors: *Water treatment, *Potable water, *Water supply, *Acquifers, Iron, Methane, Manganese, Filtration, Artesian wells.
Identifiers: *Hungary, Melyepterv.

The main source of potable water supply in Hungary is artesian waters contained in aquifers 100 to 400 m deep. The water obtained had been of good drinking water quality. Recently, however, dissolved iron and manganese have been detected in amounts exceeding allowable limits. Additionally, considerable amounts of gas containing methane have appeared in these artesian waters. Therefore, prior to introduction into the distribution network, the artesian waters must be appropriately treated by iron and manganese removal as well as by degassing. Iron and manganese are removed by a conventional technique, involving oxidation with air under pressure, followed by filtration on two-layer sand filters. Surface aeration by means of revolving brushes has been applied for de-gassing, and tests are under way on a more simplified and economical new method. (Kramer-FIRL)

WATER RIGHTS AND WATER QUALITY MANAGEMENT,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Water Resources Research Center.
W. R. Walker, and W. E. Cox.
Journal of the Hydraulics Division, American Docicty of Civil Engineers, Proceedings paper No. 11156, Vol 101, No HY3, p 511-516, March 1975. 17 ref.

Descriptors: *Water resources, *Water quality control, *Management, *Water rights, *Judicial decisions, *Institutional constraints, Administrative agencies, Letgislation, Regulation, Social needs, Planning.
Identifiers: Litigation, Restraint systems, Water uses.

Water rights constitute the oldest institutional arrangement for control of water quality, but recent decades have seen extensive development of alternative controls. These new mechanisms for water quality management have replaced the system of water rights as the primary institution for quality control, but these rights still function in an important supplementary capacity. Examined is the nature of the water right as related to quality and the reasons why a different institutional arrangement for management has become necessary. Any qualitative change that substantially interferes with other legally-recognized uses of water is in violation of water rights, but the determination of whether or not a particular quality alteration is in violation of the rights of others is a function of the judicial process. The fact that water rights require court action for their enforcement is a basic defect with regard to their effectiveness as an institution for water quality management. Specific weakness as a managerial mechanism include the responsive nature of court action, the limited scope of litigation between individuals, and the burden of proof facing the injured party. These weaknesses are largely overcome by the administrative agency approach, a basic reason for its widespread acceptance at present. Regarding water quality planning, water rights are restricted to the passive role of establishing guidelines, providing general limitations for the framework within which an administrative agency can make detailed planning decisions. AN OPTIMIZATION MODEL FOR BALANCING ECONOMIC-ENVIRONMENTAL SYSTEMS,
McGill Univ., Montreal (Quebec). Dept. of Civil Engineering and Applied Mechanics.
D. Panagiotakopoulos.
Candian Journal of Civil Engineering, Vol 2, No 1, p 1-9, March 1975. 5 fig, 8 ref.

Descriptors: *Environmental control, *Economics, *Pollution abatement, *Wastes, *Methodology, Optimization, Costs, Water quality, Treatment, Networks, Management, Disposal, Sewerage, Decision making, Operations, Water policy, Biochemical oxygen demand, Simulation analysis, Computers, Mathematical models, Systems analysis.
Identifiers: Comprehensive analysis, Data reduction, Absorbing capacity.

Resolutions of conflicts within an economic-environmental system are challenges that engineers often face, since they are expected to provide the decision-makers with the trade-offs involved among the various levels of the waste generating economic activities, the resulting environmental quality, and spending for attaining it. A methodology is presented for resolving such conflicts. The methodology is based on a waste management network model which allows for an efficient and systematic search among the possible waste management systems linking generated wastes with the environment, and also for their evaluation on the basis of the balance of their burdens on the various environmental forms and the operating budget. Recycling, discharge and effluent standards, charges, damage costs, and various budgeting schemes can be handled. Dynamic analyses for long-range financial planning under an expected increasing rate of waste generation are possible. For a simple hypothetical case, the model is set up, available data are reduced to usable forms, and trade-off curves are obtained through simulation analysis. (Bell-Cornell)

FEDERAL-STATE RELATIONS IN WATER QUALITY PLANNING,
Pennsylvania Dept. of Environmental Resources, Harrisburg.
M. S. Alushin.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY3, Proceedings paper No 11160, p 523-531, March 1975. 9 ref.

Descriptors: *Water resources development, *Water quality control, *Legislation, *Regions, *Planning, Pollution abatement, Sewage treatment, River basins, Management.
Identifiers: *Federal-state relationships.

With the passage of the 1972 Amendments to the Federal Water Pollution Control Act, the Federal government for the first time significantly entered the field of water quality planning. The 1972 Act requires two distinct planning processes: (1) Statewide basin planning designed to accomplish general water quality planning and to establish maximum daily loads for areas where waste load allocations are needed; and (2) waste treatment management planning which is designed to provide a detailed description of the physical and institutional requirements for treatment works and waste management in limited areas characterized by urban-industrial concentration. The U.S. Environmental Protection Agency delay in promulgating regulations and a lack of Federal funding during 1972-1974 resulted in virtually no planning being done during that period. Even though Section 510 of the Act reserves rights to states and preserves their ability to adopt standards that are more stringent than Federal standards, the planning processes launched by Section 303(e) and Section 208 are explicit provisions which preclude options for the states. States are required to adopt a water quality standard approach. A drastically different method of water pollution management, such as effluent charges, would be preempted by the Federal statute. Nevertheless, most of the planning and standard setting is to be done by state or local agencies. (Bell-Cornell)

WATER SUPPLIES FOR LOW-INCOME COMMUNITIES IN DEVELOPING COUNTRIES,
Birmingham Univ. (England) Dept. of Civil Engineering.
R. G. Feachem.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 101, No EE5, Proceedings paper No 11608, p 687-702, October 1975. 6 tab, 16 ref.

Descriptors: *Water supply development, *Public health, *Water quality control, Forecasting, Hydraulics, Diseases, Population, Growth rates, Effects, Resource allocation, Standards, Design, Benefits, Evaluation, Costs, Data collections.
Identifiers: *Developing countries, *Water supply impacts, Low-income, Water collection, Improvement, Water plans, Municipalities.

In 1970, the World Health Organization found that 86% of the rural population in developing countries were without safe water. Presented is an analysis of the potential impact of a water supply system in a poor tropical community; considered are techniques for quantification of this impact.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Special attention is paid to the water collection journey and to the anticipated improvements in community health. A useful approach is to identify specific design benefits and to base the design of an improved scheme on the achievements of these benefits. Various possible benefits are listed; savings in time and energy expended in water collection and improvements to health are suggested as being realistic design benefits for most situations. A classification of water-related disease is presented and the effect of water supplies on various water-related infections is analyzed. A comprehensive table, showing the principal features of these diseases, is included. Improvements to specific water-related infections can be used as design benefits for water supply schemes. A more rigorous approach to improving the standards of water supply facilities in developing countries is needed. An analysis of water supply impacts, particularly concerning water collection and health, can facilitate superior designs and more rational resource allocation for water supply programs. (Bell-Cornell)

FORMULATION AND USE OF PRACTICAL MODELS FOR RIVER QUALITY ASSESSMENT,
Geological Survey, Portland, Oreg. Water Resources Div.
W. G. Hines, D. A. Rickert, S. W. McKenzie, and J. P. Bennett.

Descriptors: *River basins, *Water quality, *Behavior, *Mathematical models, Hydrology, Alternative planning, Management, Simulation analysis, Evaluation, Physical properties, Biological properties, Chemical properties, Dissolved oxygen, Biochemical oxygen demand, Decision making, Date collections, Systems analysis.
Identifiers: Scientific assessment, Environmental impact, Model improvement, River phenomena, Date base, Willamette River(Ore.).

Complexities inherent in the study of large rivers and the need for quantitative description of river quality behavior have generated increasing interest in mathematical modeling. In concept, mathematical models have great potential as practical tools for predicting the impact of alternative planning proposals on river quality phenomena. A basis is provided for examining potential shortcomings in proposed river quality models and suggestions are made for improving them. Considered are six major deficiencies common to many applied modeling efforts: (1) application to a variable or process that is too complex for formulation of a practical, applied model; (2) application of a sophisticated, general case model without adequate understanding of the particular river in question; (3) failure to recognize the importance of basin hydrology in defining the critical planning and management decision periods for model simulation; (4) misapplication of model calibration and verification procedures; (5) use of a poor data base for interpretation, calibration, and verification; and (6) failure to format results for ease in understanding. With carefull thought and interdisciplinary teamwork, these deficiencies may be corrected and conceptual models transformed into useful tools for river quality assessment. Examples are presented from a river quality study of the Willamette River, Oregon. (Bell-Cornell)

THE INTEGRATED MULTI-MEDIA POLLUTION MODEL,
Georgetown Univ., Washington, D.C. Dept. of Economics.
I. K. Paik, J. Harrington, Jr., and F. W. McElroy.
Environmental Protection Agency Report EPA-600/5-74-020, February 1974. 259 p, 14 fig, 25 tab, 54 ref, append.

Descriptors: *Environment, *Resources, *Management, *Model studies, *Pollution abatement, Land use, Simulation analysis, Computer programs, Economics, Waste water treatment, Wastes, Diffusion, Water pollution, Rivers, Biochemical oxygen demand, Dissolved oxygen, Industries, Pollutants, Air pollution, Equations, Systems analysis, Planning.
Identifiers: *Steady-state model, *Environmental quality control, Nonlinearity, Residual management submodel, Dispersion submodel, *Integrated Multi-Media Pollution Model, Land use submodel, Metropolitan regions.

The primary objective was to develop a prototype multi-pollution model for a typical metropolitan region. The basic design and some of the results of initial testing of the model are presented. The Integrated Multi-Media Pollution Model, IMMP, views environmental pollution as a set of in terrelated problems -- the solution of which requires examination of all types of pollution jointly and simultaneously -- and attempts to seek an overall solution to environmental resouce management. Specifically, the model embodies the trade-offs among different forms of residuals disposed finally in the environment that are effected by alternative land use policies, production processes, pollution control strategies and methods. Thus, the Land Use submodel relates various land use policies to the distribution of the sources of environmental pollution. The Residuals Management submodel relates alternative levels of pollution generating activities, input mixes, production processes of various activities, and the alternative treatment processes associated therewith to the magnitude, composition and distribution of pollutants. The Disposal-Dispersion submodel relates pollution emissions at source to (ambient) environmental quality at destination. The model provides a comprehensive framework in which to test and evaluate a wide range of strategies for planning, managing and controlling environmental resources. (Bell-Cornell)

SALINITY POLICY FOR COLORADO RIVER BASIN,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
G. V. Skogerboe, and W. R. Walker.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY8, p 1067-1075, August, 1975. 1 fig, 13 ref.

Descriptors: *Salinity, *Colorado River, *Water policy, *Water quality control, *Water law, Water pollution, Saline water, Salts, Irrigation water, Desalination, Colorado River Basin, Colorado River Compact, Mexican Water Treaty, Water resources, Mexico, Water supply, Impared water quality, Costs, Arizona, California, Water management(Applied).
Identifiers: *Salinity control.

Increasing salinity concentrations in the Colorado River are threatening the utility of water resources in the downstream areas of Arizona, California, and the Republic of Mexico. The U.S. Environmental Protection Agency reports that existing damages to lower basin users would increase from $16,000,000 annually in 1970 to $51,000,000 annually by the turn of the century if planned developments do not include appropriate salinity control measure. A brief description of the most important salinity control measures is given along with a short summary of the Colorado River Compact, the Upper Colorado River Compact, and the Mexican Water Treaty. The water quality goal for the Colorado River to maintaining salinity concentrations in the lower stem at or below present levels would be better than setting numerical standards. This policy should be applied to each state by offsetting salinity detriments resulting from each new development with salinity control measures that will maintain a net salt balance leaving state boundaries. SUBMERSIBLE OIL BOOM,
Submarine Engineering Associates, Inc., Cohasset, Mass. (assignee).
R. A. Benson.
U. S. Patent No 3,859,796, 6 p, 14 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 930, No 2, p 622, January 14, 1975.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, *Water pollution control, Equipment, Barriers, Water quality control.
Identifiers: *Pollution prevention, Oil booms, Submersible oil booms.

An oil containment barrier or boom is made up of submersible barrier sections, each comprising a vertical dam, preferably at least 1/4 inch thick constructed of elastic, resilently stretchable, solid, plastic, rubberlike material having Shore A scale durometer hardness between 60 and 90 and resiliently deformable in all directions. Each submersible flotation element has an outer shell, preferably elastically and resiliently deformable in all directions. Although the shell may be charged with air or water to float or sink it, it is preferred that resiliently expandable and compressible gas-filled flotation means, perferably a closed cell plastic foam material or a sealed, gas-filled collapsible tube or gas-filled compressible spheres or other such elements, be employed to float the barrier section when expanded for fail-safe operation, together with operating means, such as a collapsible hollow operating tube, or simply the remaining volume within the shell itself, for compressing the gas-filled flotation means to sink the barrier section. DEPLOYABLE SYSTEM FOR CONTAINING OIL SPILLS,
E. N. Fisher.
U.S. Patent No 3,863,694, 4 p, 13 fig, 5 ref; Official Gazette of the uUnited States Patent Office, Vol 931, No 1, p 154, February 4, 1975.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, *Water pollution control, Equipment, Storage tanks, Soil management.
Identifiers: *Pollution prevention.

A system is described for containing oil spills or leaks from small oil storage tanks. The system comprises a diaphragm of polyvinyl chloride, synthetic rubber or the like, formed in a circular pattern of radius approximately equal to the radius of the storage tank plus its height. The circular diaphragm is placed under the tank and centered with respect thereto. The edge of the diaphragm is pleated and fastened to a tension ring which surrounds the upper part of the tank and is held in place by friction or other suitable means. When a leak occurs, the tension ring releases and slides down the tank as the diaphragm fills with escaping oil. The deployment of the diaphragm, which can be seen from many miles, particularly from the air, serves as a visual indication that a leak has occurred; in the fully deployed condition, the diaphragm is capable of containing the entire contents of the oil storage tank. The use of the deploy-

e diaphragm oil containment system prevents l, water and air pollution, substantial financial s due to unrecoverable fuel oil, and personal rdship resulting from the failure of a bulk oil oage tank. (Sinha-OEIS)

EVELOPMENT DOCUMENT FOR EFFLUENT IMITATIONS GUIDELINES AND NEW OURCE PERFORMANCE STANDARDS FOR HE TIRE AND SYNTHETIC SEGMENT OF THE RUBBER PROCESSING POINT SOURCE CATEGORY,
Environmental Protection Agency, Washington, D.C. Effluent Guidelines Div.
J. E. Riley.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-238 609, $5.00 in paper copy, $2.25 in microfiche. EPA Report 440/1-74-013-a February, 1974. 193 p, 12 fig, 30 ref, 43 tab. 68-01-1510.

Descriptors: *Waste water treatment, *Rubber, *Water quality standards, Water pollution treatment, Wastes, Industrial wastes, Water pollution sources, Water quality control, Costs, Operating costs, Capital costs, Water pollution, Water pollution control, Water quality, Standards, Economics, Synthetic rubber, Effluents, Regulation, Chemical industry.
Identifiers: *Rubber industry, *Tire industry.

Presented are findings of a study of the tire and inner tube and synthetic rubber segments of the rubber processing industry for the purpose of developing effluent limitations guidelines for the industry. The guidelines set forth the degree of effluent reduction attainable through the application of the best practicable control technology currently available and through the application of the best available technology economically achievable. The tire and inner tube and synthetic rubber segments of the industry are divided into four subcategories on the basis of the characteristics of the manufacturing processes involved. Separate effluent limitations are developed for each category on the basis of the level of raw waste load, as well as on the degree of treatment achievable by the suggested model systems. These systems include both biological and physical/chemical treatment, and for the synthetic rubber subcategories treatment of the secondary effluent by carbon adsorption. Supportive data and the rationale for development of the proposed effluent limitation guidelines and standards are discussed. Manufacturing processes, wastes, and waste treatment processes and costs are described. (Witt-IPC)

Findings are presented of an extensive study of the soap and detergent manufacturing industry for the purpose of developing effluent limitation guidelines, Federal standards of performance, and pretreatment standards for the industry. The development of data and recommendations relate to the 19 subcategories into which the industry is divided on the basis of raw waste loads and appropriate control and treatment technology. Separate effluent limitations are proposed for each subcategory on the basis of raw waste load control and end-of-pipe treatment achievable by suggested model systems. Supportive data and rationale for development of the proposed effluent limitation guidelines and standards of performance are presented. Potential approaches for achieving the limitation levels and their associated costs are discussed. (Witt-IPC)

Identifiers: *Iron and steel industry, Slags.

For the purpose of establishing effluent limitation guidelines and standards of performance for the ferroalloys industry, the industry has been categorized on the basis of the types of furnaces, air pollution control equipment installed, and water uses. The catergories include open electric furnaces with wet air pollution control devices, covered electric furnaces and other smelting operations with wet air pollution control devices, and slag processing. The effluent limitations to be achieved by July 1, 1977, are based upon the pollution reduction attainable using treatment technologies as presently practiced by the average of the best plants in these categories. The technologies are for the most part based upon end-of-pipe treatment and once-through water usage. The effluent limitations to be achieved by July 1, 1983, are based upon the pollution reduction attainable using control and treatment technologies as presently practiced by the best plant in each category. Costs are given for the various levels of treatment identified for each category and for the attainment of the suggested effluent guidelines. (Witt-IPC)

Descriptors: *Dairy industry, *Waste water treatment, *Water pollution treatment, *Water quality standards, Wastes, Industrial wastes, Water pollution sources, Water pollution, Water pollution control, Water quality control, Waste treatment, Costs, Operating costs, Capital costs, Food processing industry, Regulation, Effluents.

Findings are presented of an extensive study of the dairy products processing industry for the purpose of developing effluent limitation guidelines, standards, and pretreatment standards for the industry. The guidelines presented set forth the degree of effluent reduction attainable through the application of the best practicable control technology currently avialable and by application of the best available technology ecnomically achievable, which must be implemented by existing plants by July 1, 1977, and July 1, 1983, respectively. The development of data and recommendations relate to the 12 subcategories into which the industry has been divided on the basis of the levels of raw waste loads and appropriate control and treatment technology. Separate effluent limitations are developed for each subcategory on the basis of raw waste load as well as on the degree of treatment and control achievable by the suggested model systems. Supportive data and rationale for development of the proposed effluent limitation guidelines and standards are included. Potential approaches for achieving the reduced pollution loads and their costs are discussed. (Witt-IPC)

C. Vogt.
Avialable from the National Technical Information Service, Springfield, Va 22161, as PB-238 833, $10.00 in paper copy, $2.25 in microfiche. EPA Report 440/1-74-025-a, May, 1974. 351 p, 43 fig, 132 ref, 75 tab. 68-01-1514.

Descriptors: *Pulp wastes, *Waste water treatment, *Water pollution treatment, *Water quality standards, Wastes, Industrial wastes, Water pollution sources, Water pollution, Water pollution control, Water quaity control, Waste treatment, Pulp and paper industry, Costs, Operating costs, Capital costs, Effluents, Regulation
Identifiers: Kraft mills, Sulfite mills, Board mills.

Findings are presented of a study of the unbleached kraft, semichemical, and paperboard segment of the pulp, paper, and paperboard industry for the purpose of developing effluent limitation guidelines for existing plants and standards of performance for new plants. Effluent limitations are set forth for the degree of effluent reduction attainable through the application of the best practicable control technology currently avialable and the best avialable technology economically achievable, which must be achieved by existing point sources by July 1, 1977, and July 1, 1983, respectively. The identified technology for new sources performance standards is in-plant waste water control and secondary treatment. The identified in-plant controls and external treatment systems are avialable for implementation as they have all been deomonstrated at mills within the subcategories under study. Supporting data and rationale for the development of the effluent limitations and standrds of performance are given. Manufacturing processes, wastes, and waste treatment processes and costs are discussed. (Witt-IPC)

DEVELOPMENT DOCUMENT FOR EFFLUENT LIMITATIONS GUIDELINES AND NEW SOURCE PERFORMANCE STANDARDS FOR THE BASIC FERTILIZERS CHEMICALS SEGMENT OF THE FERTILIZER MANUFACTURING POINT SOURCE CATEGORY,
Environmental Protection Agency, Washington, D.C. Effluent Guidelines Div.
E. E. Martin.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-238 652, $6.75 in paper copy, $2.25 in microfiche. EPA Report 440/1-74-011-a, March, 1974. 175 p, 33 fig, 24 ref, 3 tab. 68-01-1508.

Descriptors: *Waste water treatment, *Fertilizers, *Water pollution treatment, *Water quality standards, Wastes, Industrial wastes, Water pollution sources, Water quality control, Water pollution, Water pollution control, Water quality, Waste treatment, Costs, Capital costs, Operating costs, Chemical industry, Phosphates, Ammonium compounds, Ureas, Nitrates, Chemical wastes, Inorganic compounds, Effluents, Regulation.
Identifiers: *Fertilizer industry.

Findings are presented of an extensive study of the fertilizer industry for the purpose of develop-

effluent limitation guidelines and standards of
formance and pretreatment standards. The fer-
er industry is divided into five categories for
e meaningful separation and division of waste
er treatment and development of effluent
delines. These subcategories are phosphate,
monia, urea, ammonium nitrate, and nitric acid
ducts. The phosphate subcategory includes all
illary operations necessary for phosphate
duction. Effluent guidelines for best practica-
control technology currently available, best
ilable technology economically achievable, and
source performance standards are recom-
nded for each category. Manufacturing
cesses, wastes, and waste treatment methods
their costs are discussed. (Witt-IPC)

R. O. Moses, and S. L. Blackstone.
Available from the National Technical Information Service, Springfield, Va 22161, as AD A0-03831, $9.75 in paper copy, $2.25 in microfiche. U.S. Coast Guard Report CG-D-82-74, December, 1971. 316 p, 155 fig, 4 ref, 25 tab.

Descriptors: *Oil spills, *Water pollution treatment, *Sea water, Water pollution sources, Oil pollution, Oil wastes. Water pollution, Water pollution control, Performance, Engineering, Filters, Testing, Design, Powerplants, Equipment, Prototypes, Filtration, Separation techniques.

The results of a systems development program (Phase I) for preliminary design of an ocean oil spill recovery system are presented. The design goal of the system is to recover and offload up to 2000 gpm of spilled oil and to operate in waves up to 5 ft in average height. The recovery system consists of an oil-recovery device mounted on a catamaran boat hull and an oil-transfer system mounted within the boat hull to offload the recovered oil. Oil is recovered by a porous oleophilic belt that performs basically as a fluid/fluid filter. The filter recovers oil from the surface of the water, filters out the excess water, and conveys the oil to squeeze rolls where the oil is extracted. Basic filter material performance testing, filter belt development, model testing, subsystem (oil recovery, oil transfer, and auxiliary power subsystems) requirements, and preliminary design are described. Descriptors: *Prototype tests, *Water pollution treatment, *Oil spills, *Equipment, Water pollution sources, Oil pollution, Oil wastes, Water pollution, Prototypes, Testing, Oil, Oceans, Pumping, On-site tests, Performance, Pump testing, Pumps.

A prototype oil spill recovery system has been designed and constructed. This report describes tests to determine the operability and preliminary operating parameters of the transfer pumping system. The tests included water pumping, viscous oil (3500 cp) pumping, and viscous oil pumping with simultaneous water injection into the suction manifold. Oil-recovery tests in a large pond at Richland, Washington are described. The tests utilized light and heavy fuel oils in calm water and 2 ft waves, with tow speeds to 2.76 knots. Procedures for at-sea tests are outlined. (See also W76-01225 and W76-01226) (Witt-IPC)

An extensive study of the secondary aluminum smelting industry was conducted for the purpose of developing effluent limitation guidelines and standards of performance. The guidelines set forth the degree of effluent reduction attainable through the application of the best practicable control technology currently available and attainable with the application of the best available technology economically achievable. The development of data and recommendations relate to waste waters generated in metal cooling, fume srubbing, and wet residue processing. The best practicable control technology currently available, the best available technology economically achievable, and the best available demonstrated control technology for each of these waste water streams are presented. The effluent limitations and standards of performance corresponding to these technologies also are presented. Supporting data and rationale for development of the effluent limitation guidelines and standards of performance are included. Costs are estimated. (Witt-IPC)

Identifiers: *Criteria, Guidelines.

The conditions of 62 solid waste disposal sites in 10 counties of south central Wisconsin were examined. The evaluation concentrated on physical environments of the existing land disposal sites and their potential for pollution of water resources. Generally, the physical environment offers good natural protection against undesirable effects of landfilling. Landfills can be constructed in almost any of the hydrogeologic environments in south central Wisconsin, provided that a suita-

l design is used for each particular environment. ypical hydrogeologic environments were ntified and classified into 10 groups. Three fac- s were used for the classification of drogeologic environments: (1) the extent and aracter of surficial deposits, (2) the position of site in the ground water flow system, and (3) pth to water table. A set of criteria useful in sit- sanitary landfills in south central Wisconsin s established and examined on a number of sites see how the criteria related to local conditions. e criteria used were: (1) type of unconsolidated diments, (2) thickness of unconsolidated sedi- nts, (3) depth to water table, (4) position of the e in the ground water flow, (5) type of bedrock, d (6) topography. Data needed for the evaluation a site and the rating of their importance, along h a suggested procedure for evaluating environ- ntal impact, were presented. (Visocky-ISWS) 76-01273

rational method for the optimization of regional aste water management systems is developed on e basis of a mathematical model and its subquent optimization using modern techniques of erations research. However, the economies of ale in interceptor and treatment facility conuction and the nonlinearity of hydraulic pipe w regimes preclude optimization by conven- nal mathematical programming, since the result- g objective functions are concave. Well proven ethods such as linear programming or solution graph-theoretical analysis are thus inappropriate. Formulation as a fixed-charge problem sults in a mixed interger-continuous variable ear programming problem, for which solution gorithms are to date insufficiently proven for neral application. Solutions proposed generally ploit the unique structure of the location oblem, yet hydraulic transportation networks nnot be treated by such existing methods. An plicit enumeration scheme is proposed to locate e optimum solution utilizing a branch and bound ethod as a search strategy. Preliminary results mpare favorably to the traditional expedient of quential technical and economic analysis, hereby a prior selection of feasible solutions is termined on the basis of empirical engineering dgment and subsequently subjected to cost anal- is. STOCHASTIC ANALYSIS AND CONTROL OF URBAN ESTUARINE WATER-QUALITY SYSTEMS: VOL I--ESTIMATION AND PREDICTION,
New York City, Rand Inst. N.Y.
S. K. Liu.
R-1622-NYC, The New York City Rand Institute, New York, December 1974. 47 fig, 7 tab, 114 equ, 27 ref, 4 appen, 110 p.

Descriptors: *Water quality control, *Estuarine environment, *Urban hydrology, *Urban drainage, *Stochastic processes, *Estimating, *Simulation analysis, Behavior, Drainage systems, Storm water, Water quantity, Pollutants, Overflow, Coliforms, Mathematical models, Equations, Systems analysis, Fourier analysis, *Forecasting.
Identifiers: Jamaica Bay(New York), Nonparametric cross-spectral method, Stochastic noise components.

Described are the interrelationships among the major components of a typical urban estuarine interactive water-quality system. The nonparametric cross-spectral method was used to analyze the responsive behavior between the rainfall and the quantity and quality of the resulting overflow, as well as the characteristics of the stochastic noise components of several drainage systems. All impulse response kernels of the resulting overflow pollutant concentration had a basic W-shaped curve, indicating the relative importance of surface washing, conduit dilution, and bottom scouring. An equation for predicting transient coliform densities in a storm/sanitary combined system overflow was derived based on the interrelationship between the quantity and quality of the internal flow system. The prediction function from rainfall to overflow estimated by the spectral method was also compared with that obtained by direct transformation using the fast Fourier transform method. The prediction functions and coliform equations were used to develop urban drainage models for estimating the quantity and quality of discharges from the peripheral drainage systems of Jamaica Bay, New York City. These models were then used (with a two-dimensional estuarine water-quality model of the bay) for simulating water-quality results from two summer storms occurring during 1972 and 1973. Control processes in urban estuarine water-quality systems should be based upon a feed-forward scheme that uses predictive functions, since most of the parameters governing control are not measurable in real time. In the United States water quality and water resources management have largely been undertaken separately. In times of water shortage, integration of these two study areas is needed to insure water supplies. Examples of water management involving San Francisco Bay and Sacramento-San Joaquin Delta (Calif), the Colorado River (Calif), the San Joaquin River (Calif), and Livermore Valley (Calif) are cited. In the latter case wastewater flows with concentrations of 700 to 1000 mg/l of salt occur in Alameda Creek (Calif) after municipal/industrial use adds 400 to 500 mg/l of salt to the water. During the dry season this has a detrimental effect on the Niles Cone groundwater basin downstream and would eventually degrade these waters. The best solution appears to be to build a reservoir to store salty waters to be released in times of high streamflow. A water quality problem is thus solved through water resource management. Efforts at unification of these management fields have been made by the National Water Commission, the Federal Water Pollution Act of 1972, Interim Basin Planning in California, the California State Water Resources Control Board and the Federal Bureau of Reclamation. The Federal Water Pollution Control Act Amendments of 1972 should be strengthened, or water resources and water quality planning should be undertaken by the Environmental Protection Administration, the Bureau of Reclamation and the Corps of Engineers. Also, state efforts, amendments to federal law, and expansion of state water rights authority are needed. (Smith-North Carolina)

Descriptors: *Research and development, *Comprehensive planning, Water resources development, *Research priorities, *Multi-purpose projects, Political aspects, *Institutional constraints, Management, Waterquality, *Canada.
Identifiers: Water quality management, *Lower Fraser River Research Project(Canada).

The usefulness of much of the research on the design of appropriate policies and institutional arrangements for water quality management is questioned. Some major limitations in research are suggested and several types of research that appear to merit greater emphasis are proposed. Some neglected proposals include: (1) the establishment of regional agencies; (2) utilization of effluent charges; (3) development of better techniques for evaluating alternative solutions; and (4) the integration of water quality management into the general task of residuals management. Decision makers follow more politically satisfying policies such as increased national management and national standards, limited regulations, and increased subsidies to induce desired behavior by waste discharges. To bridge the gap between research and policy making, new directions in research must be taken: larger number of inter-

LIBRARY U. OF I. URBANA-CHAMPAIGN

disciplinary studies of regional situations, studies on behavioral aspects of water quality management, and inclusion of problem perceptions of the public and official decision makers in research designs. The Lower Fraser River Research Project provides a model of communication between the research team and various water quality management interests. The study outlines physical, behavioral, economic and technical properties to be used with normative criteria to evaluate existing institutional arrangements for water quality management, formulate improvements and evaluate alternative institutional designs. DECISION TO CONTROL EUTROPHICATION,
Canada Centre for Inland Waters. Burlington (Ontario).
T. R. Lee.
In: Priorities in Water Management, Western Geographical Series, Vol 8, F. M. Leversedge, ed. University of Victoria, Victoria, British Columbia, p 79-97, 1 fig, 2 tab, 36 ref. 1974.

Descriptors: *Planning, *Water quality standards, Water policy, *International Joint Commission, *International commissions, *Great Lakes Region, *Eutrophication, *Phosphorous compounds, Water quality, Federal government, Great Lakes, Canada, United States, *Nitrilotriacetic acid.
Identifiers: Water quality management.

Following the issuance of a report which disclosed that phosphorous caused high levels of eutrophication in the Lower Great Lakes, the International Joint Commission (IJC) recommended specific water quality objectives which called for more public participation in the decision-making process and more public control of water quality. Subsequent events and constraints that exist on the authority of international institutions are discussed. The IJC advised public regulation of industry for the preservation of environmental quality. Although much of the IJC's report was supported on both sides of the lakes, divergences appeared between the U.S. and Canada concerning enforcement of the recommendations and emphasized the lack of authority in an international water management agency. As Canada quickly banned the manufacture, use, sale or import of phosphorous, the U.S. took no action, allowing the Great Lake states to legislate their own programs. A substitute, tri-sodium salt of nitrilotriacetic acid (NTA) was recommended by the commission and accepted for use by Canada; again, the U.S. refused support claiming that all environmental effects of NTA were unknown. Failure to agree on management strategies and water quality standards emphasized the opinion conflict between the two countries. The relationship between management of environmental quality and the decision-making structures needs examination. The eutrophication question suggests that the IJC has not been a suitable model for international environmental management. (See also W76-01347) (Salzman-North Carolina)

USER RESPONSE TO WATER QUALITY AND WATER-BASED RECREATION IN THE QU'APPELLE VALLEY, SASKATCHEWAN,
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
J. G. M. Parkes.
In: Priorities in Water Management, Western Geographical Series, Vol 8, F. M. Leversedge, ed. University of Victoria, Victoria, British Columbia, p 99-112, 2 fig, 8 tab, 8 ref. 1974.

Descriptors: Planning, *Future planning, *Decision making, Social aspects, *Non-structural alternatives, *Water quality control, *Attitudes, *Recreation, Research priorities, Water management, Behavior, *Canada.
Identifiers: Qu'Appelle Lakes(Saskatchewan), Saskatchewan.

A perception and attitude study which measures the behavioral response of a population to a specific set of phenomena can aid in assessing public views and in helping to estimate social costs incurred by changes in the environment. This study of 4 recreational Qu'Appelle Valley lakes and their adjacent areas examines how present level of water quality influences recreation and determines the extent of people's willingness to pay for improvements in water quality. Two sampling procedures were used: a water quality sampling enabled a comparison to be made over time of the water's physical condition with the public perception of its quality which was ascertained by a sampling of 560 recreation users and 240 shoreline cottage residents. Results indicated that waters met accepted quality criteria. The user survey showed that a high desire for water quality was enough to cause significant reduction in recreational uses. To improve the quality of water, users expressed a willingness to pay a high amount per user per day per season, particularly at lakes with poorest quality. In weighing water use demands against each other and determining optimum water quality levels, the decision-maker can employ user perception and attitudinal studies to aid in the final choice. More research is needed to determine the acceptable water quality criteria for recreation and to assess the value of this type of survey regarding public involvement process in planning. WATER POLLUTION LAWS AND REGULATIONS,
Missouri Univ., Columbia. Dept. of Agricultural Ecnomics.
C. G. McNabb, and D. R. Levi.
Science and Technology Guide, Missouri University Columbia Extension Division, May, 1969, 4 p.

Descriptors: *Water pollution control, *Regulations, *Missouri, *Permits, Water law, Legislation, Water policy.
Identifiers: Civil courts, Injunction, Fines.

Two approaches for resolution and prevention of the Missouri water pollution problem are (1) through the Water Pollution Board and (2) through the civil courts. In 1957 the Missouri Legilature established the Water Pollution Board, defined water pollution, and adopted a state water policy which the board must regulate. The board was authorized to take legal action against pollution in a number of ways--by fines, by tax bills, by authorization to the Attorney General to bring suit against violators, and by withholding construction permits when proposed waste treatment facilities are inadequate. A permit was to be required for any person wanting to construct, install, or modify facilities for waste disposal which discharge wastes into waters of the state. A person causing pollution may be sued for (1) an injunction, (2) damages, or (3) both an injunction and damages as a civil remedy to temporary or permanent nuisances. CURRENT LIVESTOCK POLLUTION REGULATIONS,
L. Lubinus, and F. Kerr.
Cooperative Extension Service, South Dakota State University, Brookings, August 1974, 5 p.

Descriptors: *Water pollution, *Permits, *Livestock, Water quality standards.
Identifiers: *Point source pollution, Technical assistance, Feedlot effluent standards.

Public Law 92-500 amended the Federal Water Pollution Control Act and was enacted October 18, 1972. It prohibits the discharge of pollutants (including livestock wastes) into any stream, lake or river from a point source without a permit issued from one of two offices. These permits are issued by the Federal Environmental Protection Agency's (EPA) regional office in Denver, Colorado, or from the South Dakota Department of Environmental Protection (DEP). The term 'point source' is defined in terms of large and small feeding facilities using the type and number of animals to define the size. The NPDES (National Pollution Discharge Elimination System) is in charge of the permit program at the national level. Instructions of how and where to apply for a permit are given. Feedlot effluent standards, cost-sharing programs and technical assistance are briefly discussed. (Kehl-East Central Oklahoma State)

EPA AND THE LIVESTOCK FEEDER,
National Livestock Feeders Association, Omaha, Nebr.
B. Jones.
Agricultural Engineering, Vol 55, No 3, p 30-31, March, 1974, 2 fig.

Descriptors: *Livestock, *Feed lots, *Water pollution control, *Costs, *Regulation, Runoff, Iowa, Farm wastes.
Identifiers: Tenant farmers.

Livestock operators are faced with many installation and maintenance costs in maintaining adequate pollution control facilities. One of the problems is that such investments are not cost-reducing or production-increasing. An initial installation investment for surface runoff control facilities of over $700 million would be required for beef cattle, hog, lamb and dairy control facilities in the U.S. in order to meet regulations requiring the containment of surface runoff from a 10-year, 24-hr storm. Livestock operators usually must absorb cost increases. The cost of implementing environmental regulations may prove the exception if many producers are forced out of business. (Cartmell-East Central Oklahoma State)

IMPACT OF ENVIRONMENTAL REGULATION ON THE LIVESTOCK INDUSTRY,
National Livestock Feeders Association, Omaha, Nebr.
B. H. Jones.
Presented at 1973 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 11-14, 1973, Paper No 73-5531, American Society of Agricultural Engineers, St. Joseph, Michigan. 9 p.

Descriptors: *Regulation, *Feed lots, *Costs, Livestock, *Farm wastes, *Water quality standards, *Environmental effects.

Proposed guidelines and the effect they could have on the stability of rural economics, production costs, supplies of animal products, and consumer prices are discussed. In terms of price increases and overall industry capacity, the economic impact of the proposed effluent guidelines for feedlots would not be serious. The impact of environmental regulation will fall mostly on the small operator. It is said that many of these will be forced out of business. The industry may be pushed toward the middle of the road in terms of the unit size of operation. It is important to consider that environmental control expenditure does not generate additional cash flow or new income opportunities. Such investments are not cost-

ducing or production-increasing. In fact, they e costtcreating, since they give rise to additional aintenance and other operational costs. Cartmell-East Central Oklahoma State)

his plan provides for a pattern of coordinated and ntegrated response by several departments and gencies of the Federal government to protect the nvironment from the damaging effects of pollu-on discharges. The objective is to provide effi-ient, coordinated and effective action to inimize damage from discharges of oil and other azardous substances, through containment, ispersal and removal. The plan governs the avigable waters of the United States, adjoining horelines, the contiguous zone, and the high seas here a threat to the United States waters, horeface, or shelf-bottom exists. The primary rust of the plan is to provide a coordinated esponse at the scene of an unplanned or sudden ischarge of oil or hazardous substance that hreatens the public health or welfare. Detailed lans are presented concerning each agency or de-artment's role, response, and authority in the vent of an actual emergency. (Hoffman-Florida)

Identifiers: *Nuisance(Legal aspects), Injunctive relief.

If the exploitation of natural resources is to stop, the legal structure must be conducive to that goal. Legal remedies are available for the use of individuals or groups in attacking specific acts of pollution or proposals deemed destructive to the environment. In disposing of the residues of production and consumption, the polluter makes use of free, often scarce resources including air and water, the costs of which are imposed on society. Because of the multifarious interests involved in the solution of pollution problems, solutions are not reached with optimal efficiency. Individuals have little input into legislative and administrative processes. More influence is likely to be exerted through litigation. Court action often results in the halting of pollution, or potential pollution with relatively little delay. Also, the uncertainty involved in litigation may breed in pollutors insecurities which could lead to rational planning and development. (Sperling-Florida)

Identifiers: *Water economy, Hydrotechnical structures.

Described is a methodology for solving water economy capital investment problems concerning water economy expansion to meet an increasing demand for municipal, industrial, and other uses within giver resource limitations. Considered is simulation system development, a technique for chossing the rational project variant. A water economy is an individual branch of a region, its connections and interactions with other branches of that region accounted for. The interaction of the regional management (Center) and the branch manager takes place within the framework of a centralized hierarchical system. The Center distributes the resources among managers of separate branches. The information a manager receives may be represented by the vector function of resources C(t) during the planning period. Outout information is a scalar function, which characterizes the loss to the branch if it is not sufficiently supplied with hydrotechnical structures. The first phase of the decision-making process is formulating all feasible alternatves for development of a given regional water management system. The second phase is calculating all versions of the development program for the branch. The third phase is estimating the loss which the branch may incur with a given program of branch development. The latter two phases are provided with appropriate mathematical models and numerical algorithms. (Bell-Cornell)

Descriptors: *Urbanization, *Planning, *Design, *Environmental control, *Economics, Water resources, Costs, Benefits, Pricing, Optimum development plans, Ecology, Recreation, Transportation, Roads, Decision making, Model studies, Systems analysis.
Identifiers: *Urban environment, *Natural environment, Urban development, Environmental quality, Minimal disturbance.

Various concepts concerning the characteristics of an urban system and ways in which they may be utilized in planning are discussed. One concept considers both the disturbance caused to natural systems and the necessary correction of that disturbance. The costs of each are noted to be strongly correlated, leading to the concept that minimal disturbancd requires minimal correction and results in minimal overall cost. Use of the natural environment as a control on urban environment is also discussed. The concept that the whole can be greater than the sum of the parts is used in grouping related components to form a larger subsystem, with greater overall ratio of benefits to costs. A water resources system is considered in particular. The larger sub-system may have a hierarchial structure which may also be used in planning for its improvement. The road system is considered as an example and potential benefits are discussed. Another characteristic is that some sub-systems are complementary whereas others compete, and the economic implications of this are noted. A study of the distribution of total costs of a system may further indicate where beneficial tradeoffs may occur. The use of pricing to implement an optimal plan is considered. Recommendations arising from the above concepts are presented. The above considerations may be introduced as part of a comprehensive approach to urban planning and design. (Bell-Cornell)

STRUCTURING COMMUNICATIONS PROGRAMS FOR PUBLIC PARTICIPATION IN WATER RESOURCES PLANNING,
Utah State Univ., Logan, Dept. of Civil and Environmental Engineering.
A. B. Bishop.
Available from the National Technical Information Service, Springfield, Va 22161. IWR Contract Report 75-2, U.S. Army Engineer Institute for Water Resources, Fort Belvoir, Virginia, May 1975. 125 p, 22 fig, 3 tab, 27 ref.

Descriptors: *Water resources, *Planning, *Management, *Communication, Programs, Decision making, Information exchange, Methodology, Alternative planning, Evaluation, Model studies, River basins, Water quality.
Identifiers: *Public participation, *Interactive planning, Impact assessments.

Federal legislation has demand broad public involvement in water resource planning and management. In response, agencies have promulgated policies and guidelines supporting an open planning process which incorporates a program of citizen involvement throughout. Provided for are public disclosure of information, public hearings, soliciting feedback for management decisions, etc. Although the public's role in water resource planning and management is well established, with planners responding to an enlightened citizenry, many citizens and interest groups are often excluded from meaningful participation. There is a need for continually improving interaction between planner, decision makers, and concerned public interests. Methods and techniques for planner-citizen communication which will enhance the level of public participation in the planning process and permit citizens and planners to work effectively together in arriving at decisions which affect multiple local, state, and federal jurisdictions. Considered are: (1) dynamics of the planning process, including information generation, problem identification, formulation of alternatives, impact assessment, and evaluation; and (2) communication, including communications process models, techniques for public involvement, structuring of communication programs, and an example river basin water quality management and planning problem. Water resources planners need programs through which citizens contribute most constructively to formulating proposed plans, assessing their economic environmental and social impacts, and selecting the best course of action. (Bell-Cornell)

WATER RESOURCES DECISION MAKING ON THE BASIS OF THE PUBLIC INTEREST,
Stanford Univ., Calif. Dept. of Civil Engineering.
L. Ortolano.
Available from the National Technical Information Service, Springfield, Va 22161. IWR Contract Report 75-1, U.S. Army Institute for Water Resources, Fort Belvoir, Virginia, February 1975. 53 p, 4 fig, 1 tab, 37 ref, 2 append. DACW73-73-C-0046.

Descriptors: *Water resources, *Planning, Decision making, Economic efficiency, Cost-benefit ratio, River basins, Alternative planning, Water law, Evaluation, Constraints, Flood control, Systems analysis.
Identifiers: *Public interest, *Public involvement, Pre-authorization studies, Multiple-objective planning, Weights, Factors, Impact analysis, Plan ranking, Field level planning, Alternatives, Environmental quality.

The concept of water resources decision making in the public interest is both fundamental and elusive. Alternative prespectives that have been suggested for defining the public interest are discussed and an overview is presented of the decision making involved in a typical water resources planning study. Various approaches to determining the public interest in pre-authorization planning and decision making are examined. An argument is presented in support of current trends away from reliance on economic efficiency as a basis for defining the public interest and toward the direct involvement of citizens in determining the factors and weights used in defining the public interest. The argument proceeds in three principal parts, each of which constitutes a chapter. After definition of the public interest and the nature of decision making in pre-authorization studies, Chapter Two focuses on the economic efficiency criterion for ranking alternative actions. It elaborates on benefit-cost analysis as an application for the efficiency criterion and on the ways in which the criterion was generally applied in pre-authorization studies during the 1960's. In Chapter Three recent techniques for ranking alternatives on the basis of multiple objectives are discussed in terms of how and by whom the factors and weights are determined. Chapter Four describes a process for integrating public involvement into the determination of factors and weights. Appended for illustration is Manheim's process for highway planning. (Bell-Cornell)

THE WEIBULL PROBABILITY ASSIGNMENT TECHNIQUE: AN APPLICATION TO BENEFIT-COST ANALYSIS,
California Univ., Santa Barbara. Dept. of Economics.
L. J. Mercer, and W. D. Morgan.
Water Resources Research, Vol 11, No 5, p 755-757, October 1975. 2 tab, 4 ref.

Descriptors: *Water importing, *Economic feasibility, *Cost-benefit analysis, *Probability, Projects, Timing, Water supply, Estimating, Statistics, Mathematical models, Systems analysis, California.
Identifiers: *Weibull distribution, *Santa Barbara County(Calif), Uncertainty.

The flexibility of the Weibull distribution and the information gain made possible by its use to deal with the problem of uncertainty in benefit-cost analysis are illustrated by application to a benefit-cost study to determine the minimum feasible timing of water importation, i.e., the earliest point in time when water importation would be economically feasible, for Santa Barbara County. The estimate of minimum feasible timing is developed by constructing a general economic feasibility evaluation model using cost-benefit procedures. Measures of project costs, benefits, and various parameters and conditions, both behavioral and technical, are required to implement this model. The Weibull distribution requires few estimated variables and a minimum of information, is relatively simple to work with mathematically, and can approximate the whole variety of distributions which may characterize input variables in benefit-cost analysis. Use of the Weibull distribution pro-

des the standard deviation and central tendency easures of the output (net benefit, benefit-cost tio, etc.) distribution in benefit-cost analysis as ell as the probability of outcomes indicating a oject is not economically feasible. The applica- on reported shows that the use of the Weibull dis- ibution is superior to the usual point estimates d sensitivity tests in benefit-cost analysis. (Bell- ornell)

lentifiers: *Multiple-objective planning, Goal rogramming, Surrogate worth trade off method, nvironmental Evaluation System(EES), Personal alue determination, Noncommensurable objec- ves.

ater resource agencies' attempts to include en- ironmental and social (as well as economic) ob- ctives in the evaluation process have not been ery successful. This is due to the fact that enefit-cost analysis, the method commonly em- loyed, is too limited (as currently implemented) accomodate the complexities presented by a ultiple objective approach to water resource evelopment. This article reviews several alterna- ve approaches to water resource evaluation, iscussing the advantages and limitations of each. he alternatives are categorized into two areas: athematical programming and value determina- on methods. In the mathematical programming rea, two techniques are reviewed: goal pro- amming and the surrogate worth trade off ethod. In the value determination area, Environ- ental Evaluation Systems (EES) and personal alue determination are reviewed. While these ethodologies are not all inclusive, they do present an informative cross section of the irection of research in multiple objective decision aking. It is concluded that no one methodology ffers a complete solution to the evaluation roblem; a combination of approaches need be mployed. However, goal programming surfaces s the most workable approach, considering all ob- ctives within a single model framework, with a inimum of complexity. (Bell-Cornell)

ODELING OF FUTURE EXPENDITURES FOR LANNING AND ECONOMIC EVALUATION F ALTERNATIVES,
. Koenig.
ater Resources Bulletin, Vol 11, No 5, p 933- 45, October 1975. 1 fig, 8 equ, 1 tab, 1 append.

escriptors: *Water resources, *Projects, Alternative planning, *Economics, *Evaluation, Expenditures, Engineering, Long-term planning, perating costs, Decision making, Mathematical odels, Human population, Interceptor sewers, quations, Design, Systems analysis.
lentifiers: Prediction, Cost escalation, Linear, ogarithmic.

n analysis is made of current engineering prac- ces in modeling future cash expenditures and ducing a series of them to present value so that conomic comparisons may be made among alter- ative schemes. Considered is project planning for n interceptor sewer system for an area in which e pattern of population density was predicted to hange over future years of population growth. The principles developed are applicable to any kind of engineering system or facility requiring economic decisions among alternatives with differing useful lives or differing profiles of cash expenditures over many years. Discussed herein are the reality and predictability of cost escalation, a beginning-of-period model versus an end-of-period model, the discount rate versus real interest rates, linear and logarithmic cost escalation, the present value of uniform periodic constant-dollar expenditures, cash flow in the post-project period, design into the post-project period, and continuance of performance in the post-project period. Current practices are criticized and recommendations for improvements over conventional methods in the engineering economic analysis of alternatives with different multi-year profiles of expenditures are given. (Bell-Cornell)

EFFICIENT SEQUENTIAL OPTIMIZATION IN WATER RESOURCES,
Iowa Univ., Iowa City, Inst. of Hydraulic Research.
T. E. Croley, II.
No 69, Hydrology Papers, Colorado State University, Fort Collins, Colorado, September 1974. 31 p, 12 fig, 16 tab, 77 equ, 48 ref, 5 append.

Descriptors: *Water resources, *Optimization, *Reservoir operation, *Stochastic processes, Planning, Dynamic programming, Simulation analysis, Statistical methods, Costs, Equations, Mathematical models, Systems analysis.
Identifiers: *Deterministic optimization techniques, *Stochastic optimization techniques, *Computation reduction, Data generation.

Reduction of computation effort in water resources optimization problems can be made through a modification of the optimization technique instead of through limiting development of the system models. Considerations are presented herein which lead to the development of a heuristic application of deterministic optimization techniques. The modification enables reduction of computation to take place while achieveing results that approximate the optimum. The modified application of dynamic programming is made for a single reservoir system problem to illustrate the technique and the achievement of near optimum performance. Stochastic optimization techniques that are used in water resource systems engineering are presented. A heuristic alternate stochastic optimization technique is then described and suggested as an improvement. Feasible use of this alternate is possible since observations on planning horizons are employed in computation reduction. For a single reservoir system, the techniques are applied and compared. Computation costs are reduced and system performance is improved with the use of the alternate. Several studies are outlined which illustrate changes in the technique results with changes in the problem formulation. The techniques work well for all problem variations considered here; indicated is that the techniques perform best for realistic problem formulations. (Bell-Cornell)

COGNITIVE STRAWMAN: PUBLIC INPUT TO A WATER RESOURCE PLANNING SYSTEM,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
R. M. Judge.
Ph D Dissertation, 1975. 100 p, 9 fig, 14 tab, 53 ref.

Descriptors: *Water policy, *Water resources development, *Comprehensive planning, *Planning, *Social aspects, Potential water supply, Conservation, Methodology, Water supply development, Project planning, Arizona, Water resources, Water utilization.
Identifiers: Rio Grande Valley(New Mexico).

An information system was developed to facilitate input of public values and goals into planning and evaluation processes. The technique was then applied to subjects in Arizona and the Rio Grande Valley of New Mexico in a water resources planning study. Research indicated that community values can be input to the planning process by the use of disaggregated goal structure and the quantifying function. The general allocation technique, used in mail survey, shows promise as a means of discovering community preference and providing the necessary link between professional

LIBRARY U. OF I. URBANA-CHAMPAIGN

and public goals for a water system. (McLachlan-Arizona)

ON THE MARICULTURE OF THE FLORIDA SEAWEED, EUCHEUMA ISIFORME,
University of South Florida, Tampa. Dept. of Biology.
C. J. Dawes.
Available from the National Technical Information Service, Springfield, Va. 22161, as COM 7411698, $3.50 in paper copy, $2.25 in microfiche. Florida Sea Grant Program Report No 5, August 1974. 12 p, 1 fig, 15 ref.

Descriptors: *Aquiculture, *Marine algae, *Rhodophyta, Florida, Growth rates, Planting management, Feasibility studies, Economic feasibility, Operating costs, Carbohydrates, Ecological distribution.
Identifiers: Mariculture, Eucheuma isiforme, Carrageenan, Seaweeds.

Because seaweeds containing the phycocolloid carrageenan do not meet the demand, mariculture of Eucheuma isiforme in Florida is of interest. E. isiforme is common in the Florida Keys, is a perenninal, has the highest yield of carrageenan, and grows rapidly. To determine if Eucheuma can be grown in Florida under controlled conditions to obtain an economically feasible product, mariculture procedures in either natural embayments or in culture tanks are discussed. Mariculture of Eucheuma in natural embayments would be restricted to only 2-3 harvests per year, herbivores and storms could decrease yields, and mixtures with other seaweeds would reduce the value of the harvest; however operating costs would be low. Culture tanks would eliminate or lessen these problems and permit year-around harvesting. A much higher crop per unit area than field culture ($9.72/sq m/yr compared to $0.16/sq m/yr) would result, but expenses for tank construction, water circulation, and temperature control would be greater. From the present understanding of the ecology and biochemistry of E. isiforme, mariculture seems feasible, pending pilot plant studies. (Buchanan-Davidson--Wisconsin)

WATER RESOURCES PLANNING,
O. Gibb.
Journal of the Institute of Water Pollution Control, Vol 74, No 3, p 262-276, 1975. 4 fig, 1 tab, 8 ref.

Descriptors: *Water resources development, *Comprehensive planning, *Long-term planning, *Water supply, *Water quality control, Conservation, Coordination, Demand, Effluents, Disposal, Pollution abatement, Water quantity, Water balance, Standards, Fisheries, Recreation, Land drainage, Navigation.
Identifiers: *Multiple objectives.

A survey of comprehensive, long-term planning and the optimum use of water resources in Great Britain is presented. Needed are strategies to coordinate and fulfill multiple objectives at minimum cost, with water supply and conservation and effluent disposal and pollution control as primary considerations. Other objectives include preservation of fisheries, recreation and amenity, land drainage and flood protection, and navigation. The Water Act of 1973 provides the opportunity for multi-purpose water resources development in England and Wales. The creation of powerful water authorities responsible for all aspects of the water cycle in their designated river basin should ensure the optimum development within the limits of available finance. Survey results suggest that the reconciliation of objectives in the water supply and quality control fields, within financial constraints, may necessitate challenging traditional concepts of reliability of public supplies. While individual authorities will have their own priorities in allocation of available financial resources, it seems essential that any move towards a change in traditional standards should receive general acceptance throughout the whole industry. Furthermore, it would seem desirable that the implications of such changes should be spelt out clearly both for water supplies and the residual flows in rivers. (Bell-Cornell)

CITIZEN INFLUENCE IN WATER POLICY DECISIONS: CONTEXT, CONSTRAINTS, AND ALTERNATIVES,
Washington State Univ., Pullman. Dept. of Political Science.
H. R. Doerksen, and J. C. Pierce.
Water Resources Bulletin, Vol 11, No 5, p 953-964, October 1975. 31 ref.

Descriptors: *Water policy, *Water resources, *Planning, Alternative planning, *Political aspects, Constraints, *Decision making, Social participation.
Identifiers: *Public participation, Conflicts, Models, Linkage.

The desirable proportion of citizen input into policy making and the proper mechanism for that input engender substantial conflict in the water resources arena. Nevertheless, discussions of citizen participation in water policy formation generally occur within narrow perspectives both with regard to the issues involved and the alternative mechanisms by which that participation can be realized. This paper examines the historical and current contexts of the controversies and presents a discussion of the alternative processes for citizen influence, called linkage. The linkage processes discussed include direct participation, citizen advisory committees, the pressure group model, the electoral model, and the bureaucratic model.Each linkage process is discussed in terms of who is considered the public, how the public influence works, the limitations of the process, and what available water policy-related data suggest regarding the adequacy of the process. Descriptors: *Water management(Applied), *Nonstructural alternatives, *Water supply development, Instrumentation, *Planning, *Water policy, Environmental engineering, *Water quality control, Water resources, *Pricing, Alternative water use, Potential water supply, Water conservation, Water pollution control, Cost-benefit analysis, Great Lakes, Management.
Identifiers: Tijuana River(U.S. Mex), Citizen participation.

The 13 papers in this volume develop the theme 'Water Resources Management: Traditions and Tasks' into 6 subject areas: Engineering Environmental Hazards; Hind-sight Evaluation; Water Quality Management; Water Pricing Policies; Institutions and the Public; and Planning and Policy-Making. Citing national and international case studies, a variety of water management issues, particularly evaluation and policy formulation, are explored. Planned versus realized cost-benefits of multipurpose projects becomes the focus of dealing with hindsight analysis. The papers discuss policy design and strategies of water quality management. Eutrophication control of the lower Great Lakes provides an example of the application of planning and decision-making possibilities of an international water body. 'Water Pricing Policies' explores the feasibility of replacing supply management with demand management through the use of pricing policies such as seasonal pricing, peak load pricing and domestic water metering as alternatives to technological solutions. Guidelines for citizen participation in the decision-making process are developed from case studies which outline and evaluate established water management programs in the Great Lakes, Tijuana River and three U.S. rivers. In the last section, W.R. Sewell identifies basic water management problems, and then outlines strategies for planning, policy formulating and decision making. BENEFIT-COST ANALYSIS AND MULTIPLE-PURPOSE RESERVOIRS: A REASSESSMENT

F THE CONSERVATION AUTHORITIES' RANCH DEER CREEK PROJECT, ONTARIO,
niversity of Western Ontario, London.
D. Day.
: Priorities in Water Management, Western Geo-aphical Series, Vol 8, F. M. Leversedge, ed. niversity of Victoria, Victoria, British Columbia, 23-35, 2 fig, 1 tab, 6 ref, 1974.

escriptors: *Cost-benefit analysis, *Economics, Feasibility studies, *Project planning, Reservoirs, *Project benefits, Construction sts, Real benefits, Estimated benefits, Intangi-e benefits, Decision-making, Water policy, anada.
entifiers: *Branch Deer Creek, Ontario.

mparison of benefits and costs anticipated dur-g the project planning in 1967, and a reassess-nt in 1971 of the Deer Creek reservoir and road, derlines the disparity between estimated costs d incurred costs as well as inaccurate assump-ns made by the analysts. Deer Creek watershed s forest and agricultural land of excessive soil isture and low fertility. Anticipated primary nefits were a new road and increased farm oductivity due to improved irrigation water ailability. Intangible benefits would be increased mestic water supply, groundwater tables, reation, firefighting, regional economic growth, d flood control opportunities. Originally esti-ated to cost $579,000, the completed project sts had increased 15% to $686,000. Erroneous lculations developed from not accounting for all tial costs (original feasibility study, $8000; rise land acquisition from $5,000 to $40,000; and rise engineering fees from $47,370 to $84,000); as-ming farmers' willingness to increase produc-ity and change crop selection patterns when sur-ys indicated otherwise; disregarding fact of ex-ing ample water supply for domestic water uses, efighting and livestock watering. The claim that e project would promote regional economic owth seems improbable. Although recreational portunities did increase, final assessment in-ates that only 44% of project costs were tified. Need for 56% of project expenses at-buted to building of the road was not explained. sed on primary conservation benefits, the nefit-cost ratio of the Deer Creek project was after 2 years of operation since farmers did not nt sufficient tobacco to claim minimum irriga-n benefits. Assessing project feasibility is ectly affected by inadequate review procedures d ineffective interagency coordination among vernmental agencies. (See also W76-01347) lzman-North Carolina)

bate over construction of the Tryweryn of Llyn yn reservoir in Wales by the City of Liverpool phasize the conflict situation concerning ource development. The controversy is iewed to determine what lessons emerge from a ource development project in which values ed on different uses of water resources were direct conflict. Tryweryn was perceived as a g term, large scale project which through scale nomy savings would best satisfy increasing water demands of Liverpool. Opposition to the reservoir focused on the validity of the initial benefit-cost analysis, over-estimation of industrial needs and residential growth, and the exploition of Welsh resources. Environmental and social costs, including damage to an already declining agricultural area, were not considered. A more equitable, comprehensive management strategy requires more than one perspective to be considered. This controversy demonstrates the inability of current methods to identify, define, measure and compare different social concerns (ecological, economic and social values). A water management system must reflect effective water uses and show an interrelationship with other plans and values of society. Adequate criterion must be developed to evaluate benefits and cost, optimum size, and priorities of values with respect to those values. This hindsight evaluation suggests that the instrument for resolution of the conflict of values will be the political process. (See also W76-01347) (Salzman-North Carolina)

WATER MANAGEMENT AND PRICING POLICIES IN ENGLAND AND WALES,
London School of Economics and Political Science (England).
J. A. Rees.
In: Priorities in Water Management, Western Geographical Series, Vol 8, F. M. Leversedge, ed. University of Victoria, Victoria, British Columbia, p 163-194, 4 fig, 3 tab, 37 ref. 1974.

Descriptors: *Pricing, *Water supply, *Legislation, *Marginal costs, Water distribution(Applied), River basin development, Water rates, Reservoirs.
Identifiers: *United Kingdom, Malvern(UK), Metering of water use, Regional Water Authority, 1945 Water Act(UK), 1963 Water Resources Act(UK).

In the United Kingdom, lack of control over independent abstractions of water resulted in aquifer exhaustion and overpollution and inefficient development of new storage capacity. Three responses have occurred: (1) larger engineering schemes, with storage capacity, transport and cleaning facilities being developed to meet all foreseeable peak requirements in all areas; (2) changes in management structure of the water industry with reduction of the number of supply undertakings and introduction of a system of coordinated water management at the river basin level; and (3) steady removal of common law water rights to use stream courses and aquifers. Right to dispose of effluent has been curtailed and rights to obstruct water have been limited. Improved pricing techniques are provided in the 1974 Water Bill which transfers responsibility for revenue raising from local water and sewerage authorities to ten Regional Water Authorities. All water uses are to financed directly from charges made for services given and permits metering of all types of water use and charging on a quantity- taken basis. This could allow for metering domestic consumers and establishment of effluent charges, two measures hitherto strongly resisted. Under optimal pricing arrangements, the consumer pays the long run marginal costs which allows water to be allocated efficiently between competing uses. Using data obtained from Malvern, England, which has successfully enforced water metering to control demand, a forecast is made that metering can cause a decrease of over 20% in water demand. The merits of introducing metering in England and Wales are discussed with special attention given to cost of metering new property. Disposal of effluent is now subject to control on the quality, quantity, and timing of discharge. (See also W76-01347) (Salzman-North Carolina)

THE ROLE OF THE PUBLIC IN DECISION-MAKING,
Wisconsin Univ., Madison.
E. L. David.
In: Priorities in Water Management, Western Geographical Series, Vol 8, F. M. Leversedge, ed. University of Victoria, Victoria, British Columbia, p 203-215, 14 ref. 1974.

Descriptors: *Decision making, *Attitudes, *Planning, *Coordination, *Institutions, Social aspects, Non-structural alternatives, Surveys.
Identifiers: *Susquehanna River Basin, *Brandywine River Basin, *Wisconsin River Basin, *Public participation, Gaming simulation.

If those who are affected by decisions are not involved in the decision-making process, inefficient and inequitable decisions will result. Problems of perceptions and interaction, composition of the relevant i and relationships between the public and institutions involved in water management are discussed. Although there are constraints on the use of survey research as a tool for public participation it can be used to inform decision-makers of public opinions and attitudes, to determine amount of information the public has on a particular topic, and to isolate opinions, goals and perceptions of sub-groups. Public hearings, a very limited tool, generally Poorly and selectively attended, tend toward an adverse mechanism between an under- informed, ill-organized public and a well-organized bureaucracy. Gaming simulation can expose the need for cooperation. There seems to be a broad potential for the gaming simulation technique which is only beginning to be explored. The challenge is to design institutions which will coalesce interested subgroups and bring their interest to bear throughout the decision-making process while insuring that the broadest feasible range of well-informed interests is represented. THE ROLE OF THE ACADEMIC IN WATER RESOURCES POLICY-MAKING: THE TIJUANA RIVER, A CASE STUDY,
California State Univ., San Diego.
E. Keen.
In: Priorities in Water Management, Western Geographic Series, Vol 8, F. M. Leversedge, ed. University of Victoria, Victoria, British Columbia, p 241-255, 9 ref. 1974.

Descriptors: *Water supply development, *Cost-benefit analysis, *Social aspects, *Planning, *Political aspects, *Environmental effects, *Flood control, Water resources development, Ecology, Mexico, United States, Decision-making, Flood plains, Data.
Identifiers: *Tijuana River(Calif-Mexico), Tijuana River Flood Control Project, Academic community, Public participation.

Proposed for the Tijuana River Basin, an area of sparse vegetation situated in both Mexico and the United States, the Tijuana River Flood Control Project would control a high, but infrequent, runoff (3800 cubic meters/sec runoff occurring once in over 300 years) presently controlled by 3 large storage dams which would not contain a 100-year flood. Initially endorsed by the Army Corps of Engineers the project was suspended by Congressional inaction and probably will be killed by local governments after increasing public opposition underlined the increasing environmental and social costs, as well as capital costs to be incurred by the communities, that were not considered in the Corps benefit-cost analysis. The author, a geographer who organized the opposition forces and distributed information extensively researched, discovered manipulation of data by the Corps to alter the benefit-cost analysis and concluded that the project completion decision was political, not economic. Results of a study by local citizens, including faculty, indicated the project was wasteful of environmental as well as fiscal resources; damage to a salt marsh and farmland coupled with the high costs provided the arguments against the project. Subsequently, the public selected ecologically concerned government leaders in the next election who stopped the project. Realizing the leadership and testimony provided by academic personnel added to the effectiveness of the opposition, it is suggested that faculty members be obliged to contribute 20% of the academic responsibilities to service to the community as researchers, political decision-makers, interest group leaders and teachers of community participation. WATER RESOURCES PLANNING AND POLICY-MAKING: CHALLENGES AND RESPONSES,
Univ. Victoria. (British Columbia).
W. R. D. Sewell.
In: Priorities in Water Management, Western Geographic Series, Vol 8, F. M. Leversedge, ed. University of Victoria, Victoria, British Columbia, p 259-286, 2 fig, 57 ref. 1974.

Descriptors: *Planning, *Potential water supply, *Research and development, *Water allocation(Policy), *Water policy, *Attitudes, *Decision making, Institutions, Non-structural alternatives, Social values, Social participation.
Identifiers: Public participation.

Contemporary water resources management faces 3 challenges: problem complexity and severity, competition for investment, and shifts in social values. These challenges imply a need for a broadened perspective in water management which accounts for economic, social, and ecological consequences and which examines alternative ways of dealing with a problem. Water shortages coupled with decline in quality has caused over-extraction of 'pure' sources and increasing demand between competitive users. As supplies decrease, increased investment in water projects is expected to provide greater economic and social benefits. Skepticism concerning the adverse impacts of major water development projects as well as demand to participate in the decision-making process reflects the public's change in attitudes. Conventional means (the public hearing, the ballot box or referenda) of assessing public views do not seem to indicate public wants or reactions to proposed plans. The planning and policy-making model outlined described its processes as a series of sequential steps, identifying the goals or policy, specifying the problem, listing potential strategies, evaluating these, selecting a strategy and then implementing it. The processes include feedback loops to allow hindsight review of performances. To eradicate the weaknesses in water resource management such as identification of goals, range of alternatives and policy review requires increased public involvement in the planning process as well as adoption of economic principles. Research is needed to develop techniques to evaluate a wide range of strategies and improve mechanisms to increase citizen participation. (See also W76-01347) (Salzman-North Carolina)

Price policy secures a link between investment in water supply facilities and the allocation and use of water supplied. The existing water rates policy tends to encourage water use and needlessly large water supply systems. An alternative price policy is discussed. The peak load price policy allows a more effective control of water demand and supply expansion. Demand control technology is needed in the urban water supply industry. (CSIRO)

THE POTENTIAL IMPACT OF PEAK LOAD PRICING ON URBAN WATER DEMANDS: VICTORIA, BRITISH COLUMBIA, A CASE STUDY,
Victoria Univ. (British Columbia).
W. R. D. Sewell, and L. Roueche.
In: Priorities in Water Management, Western Geographical Series, Vol 8, F. M. Leversedge, ed. University of Victoria, Victoria, British Columbia, p 141-161, 2 fig, 7 tab, 14 ref. 1974.

Descriptors: *Water demand, *Water management(Applied), *Pricing, *Elasticity of demand, Non-structural alternatives, Cost allocation, Marginal costs, Water supply, Canada.
Identifiers: *Peak load pricing, *Victoria(British Columbia), *Seasonal pricing, David Hanke model, Sewell-Roueche model, Price elasticities.

The emerging crisis in urban water management stems from the problem of satisfying demands. A critique on urban water pricing policies suggests that present prices based on average costs cause water outputs which exceed supply capacity and result in waste. Ideally, pricing policies should be based on marginal costs, and the price of water supplied in peak periods should carry the full cost of supplying it. Tod determine prices, the elasticity of demand must be estimated. After citing several studies undertaken to estimate demand of water, this paper tests their conclusions against a case study in Victoria, British Columbia, in hopes of refining the theory relating to demand analysis. The Victoria water supply system was assessed on variables of consumption, price income, average summer temperatures and average summer rainfall. These data served as aids in computing a demand function which indicated that temperature and rainfall were significant variables and that price had no effect on summer demand. Study results show that demand is moderately inelastic although, surprisingly, peak period elasticities are lower than off-peak elasticities. Seasonal pricing would stimulate reduction in peak demands and encourage increase in off-peak demands resulting in a more continuous use of a larger proportion of

t| facilities. (See also W76-01347) (Salzman-

M POLLUTION: HOW REGULATIONS AF-
T YOU.
essful Farming, Vol 72, No 8, p 30, June-July,

Descriptors: *Permits, *Regulation, *Livestock, *Farm wastes, Waste storage, Waste disposal, Cost sharing, Legal aspects, Feed lots, Cost sharing.
Identifiers: *Laws, Farm pollution, Stock yards.

Several states now administer Federal discharge permits. Only one permit is needed which covers both state and Federal regulations. But in most states, you need two permits--both state and Federal. All livestock facilities, which have a waste discharge and which hold for 30 days the following number of animals, must apply for a permit: slaughter and Feeder cattle-1,000; mature dairy cattle-700; all swine over 55 lbs-2,500. Livestock confinement facilities include open feedlots, confined feeding operations, stockyards, livestock auction barns and buying stations. Non-point source regulations are gaining consideration. Information and instructions on how to apply for permits and where to get cost-sharing help is given. (Cameron-East Central Oklahoma State)

MANAGEMENT OF THE INTERNATIONAL GREAT LAKES,
Cornell Univ., Ithaca, N.Y.
L. B. Dworsky.
In: Priorities in Water Management, Western Geographical Series, Vol 8, F. M. Leversedge, ed. University of Victoria, Victoria, British Columbia, p 217-239, 9 ref. 1974.

Descriptors: *International Joint Commission, *Management, *Planning, *Comprehensive planning, *Regional development, Non-structural alternatives, Administration, Institutions, Water management(Applied), Government, *Great Lakes.
Identifiers: Boundary Water Treaty.

Following the Boundary Water Treaty (1909), the International Joint Commission (IJC) was formed by Canada and the United States to manage the rivers and lakes sharing the common boundary by constructing dams and hydroelectric power facilities, controlling water pollution and floods, exchanging lands affected by changed water courses and undertaking other tasks assigned by either country. The institutional structural inadequacies of the IJC in meeting these obligations became the focus of a Canada-U.S. University Seminar attempting to develop an alternative management plan which could effectively meet current problems such as deterioration of water quality, diffused public interest, apathy, skewed national priorities, inadequate legislation, special interest politics, fragmentation of responsibilities and organizational jealousies. To resolve these conflicts, the seminar, comprised of academies, students and government officials, proposed two alternatives: (1) organizational improvements to remove constraint of allowing IJC to act only on referred matter and permit a more active role in public decision-making process, and (2) establishment of a joint management agency with a joint budget and administrative procedures, initiatory authority for planning, surveys, and research to develop a comprehensive and integrated approach to management using joint information collection and analysis, and public reporting. The study process provided large opportunities for small group dialogue which emphasized independence, credibility, fairness and objectivity. (See also W76-01347) (Salzman-North Carolina)

RECOMMENDATIONS BY PACEM IN MARIBUS V TO THE U. N. CONFERENCE ON THE LAW OF THE SEA,
Center for the Study of Democratic Institutions, Santa Barbara, Calif.
E. M. Borgese.
Environmental Conservation, Vol 2, No 1, p 14-16, Spring, 1975.

Descriptors: *International law, *United Nations, *Law of the sea, International waters, Foreign countries, Exploitation, Mining, Regulation, Governments treaties, Political constraints, Manganese, Boundary disputes, Jurisdiction, Legal aspects, Administration, Minerology, Fishing, military aspects, International commissions, Beds.

entifiers: *Pacem in Maribus, *United Nations nference on the Law of the Sea(UCLOS), Disnament, Living resources, Water column.

e Fifth Pacem in Maribus Convention held in ptember 1974, once again emphasized that an ean regime must encompass the oceans as a hole and be considered as a sub-system of the tire global system. Four main areas of concern nerged: (1) the need for a more precise definition the limits of national jurisdiction; (2) problems management of national and international ocean ace; (3) the need to take full cognizance of scienic advances in framing the Law of the Sea' and conflicts and gaps in areas covered by the rking committees. Control of fishing and other ing resources, disarmanent and arms control in oceans, and international regulations as to the e of ocean space were other areas of concern. e main contention of Pacem in Maribus is that tivities on the sea-bed cannot be dissociated m activities in the water-column, at the surface, d at the atmospheric level. There must be an ingrated management system for ocean space. arrish-Florida)

FORMER FEES UNDER THE REFUSE ACT: ECIDING WHO GETS WHAT,
. P. Buren.
vironmental Law, Vol 5, No 2, p 321-329, 1975, ref.

scriptors: *Rivers and Harbors Act, *Navigable ter, *Pollution abatement, Wastes, Environntal effects, United States, Water quality, doption of practices, Judicial decisions, Water llution control, Pollution taxes(Charges), gislation, Costs, Water pollution, Water pollun sources, Legal aspects, Law enforcement, ater quality control.
entifiers: *Informer's fees, *Fines, *Refuse Act 1899.

nder the Rivers and Harbors Act of 1899, one lf of the fine levied against an offender for scharging unauthorized refuse into the navigable ters of the United States is awarded to anyone ving information leading to the conviction of the fendant. In multi-count actions against modern dustrial polluters, however, there arises the posbility of frequent unearned windfalls to parties oviding relatively little evidence to the prosecun. Originally, only one form of discretion was fered courts in determining informers' fees der the act, that is, the power to decide if the inrmer 'qualified' as a provider of original infortion. A 1972 decision, United States v Anacon- Wire and Cable Co., appears to give courts de discretionary powers in determining the ount of the award as well. A claimant under aconda no longer must show he was the first inrmer; instead, the court may look to the 'totality the circumstances' to determine an appropriate ward. Further modification and clarification of Refuse Act in this area is likely. (Parrish-orida)

ATER AS A TOOL IN LAND USE CONTROL, GAL CONSIDERATIONS: AN EXPLORATOY ESSAY,
hite and Burke, Fort Collins, Colo.
D. White.
cky Mountain Mineral Law Institute Annual, l 20, p 671-690, 1975. 60 ref.

scriptors: *Regulation, *Planning, *Land use, and resources, *Water policy, Water resources, atershed management, Local governments, ning, Permits, Judicial decisions, Legal aspects, litical aspects, Land, Land development, Land nagement, Water management(Applied), Water rmits, Water law.
entifiers: State policy, Water rights(Non-riparis), Nuisance(Legal aspects).

The issue to whether water resource planning or land resource planning should predominate in land use control has received little attention. Water supply can be controlled at the point of effluent discharge, at the water tap, and at the source of supply. Unrealistic water quality restrictions create a hardship on irrigation practices when control is exercised at the source of discharge. Efforts to alleviate pressure on inadequate municipal water and sewage treatment facilities by timephased zoning have drawn mixed judicial attention. Municipal regulation of watersheds often clashes with broader-based efforts. Condemnation of water rights may facilitate land use goals if money is available to compensate those whose water interests are condemned. Police power regulation which does not require compensation can be exercised through public nuisance legislation, zoning, and transferable development rights. The legal and institutional effects of policy decisions regarding water and land use controls need further exploration. (Jenkins-Florida)

DEPARTMENT OF ENVIRONMENTAL PROTECTION V JERSEY CENTRAL POWER AND LIGHT CO. (DAMAGES FOR FISH KILL FROM DISCHARGE OF COLD WATER INOT NORMALLY WARMED WATER),
5 ELR 20370-20373 (Super Ct. NJ App. Div., 1975). 4 p.

Descriptors: *Thermal pollution, *New Jersey, *Judicial decisions, *Industrial wastes, *Radioactive wastes, Cooling water, Industrial plants, Industrial water, Waste water treatment, Aquatic life, Ecology.
Identifiers: Atomic Energy Commission, Nuclear reactors.

After its nuclear generating plant was temporarily shutdown, the defendant continued to discharge cold rather than warm water from its pumps. Because of this cold discharge into the normally warmed waters of the creek, a large fish kill occurred. Defendant was convicted for a statutory violation for introducing a hazardous or destructive substance into state waters. In addition to statutory penalties, the state was allowed to receive, under the doctrine of parens patriae, compensatory damages for the fish kill. On appeal the defendant argued that the statute was unconstitutionally vague in that it did not specifically mention thermal pollution. The defendant also argued that the temporary shutdown that resulted in cold, rather than warm water being discharged, was necessitated by an Atomic Energy Commission (AEC) requirement that the reactor be shut down when the leakage of reactive coolant reached a certain level. The court rejected both arguments, and as to the second, found that the cold water pumping was not the result of the AEC directive, but was done to facilitate resumption of the generator operation after repairs had been completed. The continued discharge was held negligent under the circumstances, and the defendant was properly liable for compensatory damages. (Hoffman-Florida)

WATER 'MINING' DECLARED UNLAWFUL UNDER IDAHO GROUND WATER STATUTE.
Rocky Mountain Mineral Law Newsletter, Vol 7, No 2, p 1-2, February 1974.

Descriptors: *Water policy, *Idaho, *Hydraulic mining water, *Judicial decisions, Legal aspects, Legislation, Exploitation, Water loss, Water consumption, Water management(Applied), Water allocation(Policy), Water control, Water utilization, Water resources, Water resources development, Water law.
Identifiers: *Injunctive relief.

In a full-scale review of Idaho underground water law, the Idaho Supreme Court determined that the provisions of the Idaho Ground Water Act forbid mining of an aquifer. Senior groundwater appropriators brought an action to enjoin junior appropriators who were pumping from their common aquifer. The trial court, on the basis of conflicting testimony of three hydrology experts, found certain priorities of development of the appropriators' wells. It determined that an injunction should issue to stop mining of the aquifer at rates greater than the annual recharge rate. On appeal to the Idaho Supreme Court appellants asserted that they were entitled to a pro-rata share of the water under the correlative rights doctrine and that the Ground Water Act only protected senior appropriators from unreasonable pumping levels by the juniors. The Court found that Idaho had expressly rejected that theory in 1931 and that the statutory scheme of the Idaho Ground Water Act had not reintroduced the doctrine. The Court concluded that the lower court's findings were supported by substantial evidence and affirmed. (Proctor-Florida)

ALASKA SUPREME COURT REJECTS BROAD STATE NAVIGATIONAL SERVITUDE NO-COMPENSATION RULE.
Rocky Mountain Mineral Law Newsletter, Vol 7, No 2, p 1-2, February 1974.

Descriptors: *Condemnation, *Eminent domain, *Judicial decisions, *Navigable waters, *Legal aspects, *Alaska, Cost repayment, Economics, Economic impact, Government, Water resources development, Water law, Bodies of water, Riparian rights, Riparian waters.
Identifiers: *Inverse condemnation, *Navigational servitude.

For 20 years, plaintiff had used a creek and the tides for access from his property to the deep waters of Cook Inlet for his commercial fishing boats. The State of Alaska constructed a federal aid highway across the creek and tideland blocking the high-tide water flow up the creek and destroyed the creek's navigability, as well as plaintiff's access to Cook inlet. Plaintiff sued for inverse condemnation. The lower court dismissed the complaint for failure to state a valid claim for relief because the state's action was a non-compensable taking pursuant to the state navigational servitude. The Court reviewed three general variations of the doctrine of navigational servitude. The general rule provides for compensation for taking unless the project is in aid of navigation. The public purpose variation prohibits compensation if the project is for any public purpose. The Louisiana exception is applicable solely to that state. The court adopted a restricted version of the general rule allowing compensation if property is taken for a non-navigable purpose. (Proctor-Florida)

OPTIMAL ENVIRONMENTAL JURISDICTIONS,
Roosevelt Univ., Chicago, Ill.
R. O. Zerbe.
Ecology Law Quarterly, Vol 4, No 2, p 193-245, 1974. 3 tab, 22 ref.

Descriptors: *Federal jurisdiction, *Local governments, *Optimization, *State jurisdiction, *Political constraints, Water pollution control, Air pollution, Environmental control, Pollution abatement, Property values, Industries, Social aspects, Land use, Political aspects, Water rights, Governmental interrelations, Jurisdiction.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Identifiers: Monopsony, Economic incentives, Administrative regulations, Environmental policy, Water rights(Non,riparian), Local jurisdiction, Federal Water Pollution Control Amendments of 1972, Auto emission control, Optimal environmental jurisdictions.

Effective environmental controls depend partially on the control jurisdiction. The federal government's power over air and water resources greatly exceeds that of state and local government. The capacity for local pollution control has been underestimated. In determining the optimum jurisdictional arrangement, net social benefits rather than exclusively political values should be considered. Local incentives for pollution control may be present where pollution causes a decrease in property values and local revenue. Exclusionary zoning standards which are too severe may divide a community along income lines with the adverse effects of control felt by lower income groups. Competition among localities for new industry does not mitigate incentives for local environmental control but is a desire equilibrating process. Local environmental control will also benefit nonresidents through pricing signals. Another issue of control jurisdiction is that of undue uniformity of federal pollution standards. Such uniformity is often inefficient and inequitable. One example is motor vehicle pollution standards. A control jurisdiction must be large enough to eliminate important interjurisdictional pollution and take advantage of scale economics. Air and water pollution control can be maximized by regional or local jurisdiction. Federal jurisdiction over research, however, remains desirable. (Jenkins-Florida)

A PRIMER ON THE BOUNDARY WATERS TREATY AND THE INTERNATIONAL JOINT COMMISSION,
P. Pantaleo.
North Dakota Law Review, Vol 51, No 2, p 493-508, 1974. 145 ref.

Descriptors: *International Joint Commission, *Treaties, *International law, *Canada, *United States, *Salinity, Water quality, Water properties, Legal aspects, Foreign waters, International waters, Foreign countries, Jurisdiction, Water pollution, Water law, Path of pollutants, Water pollution effects, Water pollution control, Water pollution sources, Water quality control, Organization, Saline water intrusion.
Identifiers: Garrison Diversion Project, *Boundary Waters Treaty of 1909, Nuisance(Legal aspects).

Discussed are possible legal avenues available to Canada through the Boundary Waters Treaty of 1909 and the International Joint Commission for problems caused by the Garrison Diversion Project which has increased the salt level of the Souris River. The appliability of the treaty to Canadian objections to Garrison Diversion is examined by outlining the history of the treaty and the reasons for its formulation. A detailed analysis is presented of the organization functions and procedures of the International Joint Commission established by the treaty. It is concluded that an individual Canadian injured by the Garrison Diversion Project would have no problem suing in an American court on a nuisance theory. Another alternative a Canadian might pursue would be securing the intervention of his government on his behalf. The Canadian government could secure the investigation of the alleged pollution by the Commission or attempt to secure the consent of the United States government to arbitration under which both countries would be bound by the arbitration decision. HAWAIIAN BEACH ACCESS: A CUSTOMARY RIGHT,
M. D. Tom.
Hastings Law Journal, Vol 26, No 3, p 823-847, 1975. 172 ref.

Descriptors: *Hawaii, *Beaches, *Public access, *Easements, Water law, Legal aspects, Coasts, State governments, Legislation, Judicial decisions, Constitutional law, Common law, Public rights, Equity, Land tenure, Trespass, Seashores, History, Recreation.
Identifiers: *Customary right doctrine, Public trust doctrine, Hawaiian legal history, Estoppel, Piscary rights.

Commercial development in Hawaii has significantly reduced public access to the state's beaches. To obtain an effective balance between the conflicting interests of the public and the upland owners, a customary right doctrine should be utilized to establish a public right of beach access, and a traditional abandonment concept should be applied to protect upland private property rights. Through the customary right doctrine, particular local custom can acquire the force of law. The development of the doctrine is traced and its applicability is considered in light of Hawaiian history, judicial decisions, and legislation. The requirements for application of the doctrine are discussed, both generally and within the context of Hawaiian law. Hawaiian decisions concerning piscary and water rights are examined, and the conclusion reached that the customary right of beach access was historically a public right which the sovereign could not convey. Recent cases concerning beach ownership are discussed, as are the constitutional issues relevant to the proposal presented. Where appropriate, the Hawaiian courts can protect the rights of upland owners by curtailing or modifying the access right through the doctrine of extinguishment. (Schilling-Florida)

LAWMAKING FOR THE SEAS,
J. R. Stevenson.
American Bar Association Journal, Vol 61, p 185-190, February 1975. 1 photo, 2 ref.

Descriptors: *United Nations, *International law, *Law of the sea, *Negotiations, Treaties, Legal aspects, Water rights, Boundary disputes, Governments, International waters, Navigation, Fishing, Resources, Organizations, Foreign countries, Foreign waters, Water law, Oceans.
Identifiers: *Coastal waters, *United Nations Conference on the Law of the Sea.

The Third United Nations Conference on the Law of the Sea is discussed. The fundamental task of this conference is to agree on a local regime governing the activities of men and nations on the world's oceans. The law of the sea negotiations are described as an example of the international lawmaking process and those aspects of the process that appear to be most constructive in facilitating agreement on a constitution for the oceans are discussed. The spiral of competing and escalating claims to the use of the same ocean space and resources have made it necessary to have a system of international as opposed to national law for the world's oceans. The most viable solution to this lawmaking for the oceans is a comprehensive multilateral treaty. All areas of dispute should be resolved within one document rather than individual agreements which serve the special interests of particular nations. The international lawmaking procedures followed may also contribute to the ultimate success or failure of the conference. The following procedural aspects are discussed: (1) decision making; (2) the role of committees and working groups; and (3) the establishment of rule-making machinery and compulsor dispute settlement (Nursey-Florida)

CEMENT PRODUCERS CONFRONT ANTI POLLUTION LEGISLATION,
G. L. Koonsman
Rock Products, Vol 74, p 161-162, 184, 186, October 1971. 1 photo

Descriptors: *Concrete technology, *Rivers an Harbors Act, *Industrial wastes, Wast water(Pollution), Slurries, Water pollutio sources, Navigable waters, Permit, Legislatior Law enforcement, Water requirements, Coolin water, Industrial water, Water supply, Wate treatment, Waste water disposal, Environmenta sanitation.

The Rivers and Harbors Act of 1899 prohibits th discharge of refuse matter into any navigabl water without a permit from the Secretary of th Army. One-half of the fine collected is paid to th person or persons whose information leads to conviction under the Act. All cement plants us and discharge water. As pollutors, they will fin more and more concern being given to the quality of water they discharge. Cement plants use wate for such purposes as cooling, dust collection, dus leaching, cleaning and fire protection. If disposa of the soils is not handled carefully, it may be i violation of the Rivers and Harbors Act. In addi tion two hundred and fifty residents are filling ou federal water quality questionnaires which seel various types of information. Industry has shown concern over the questionnaire on two points. Wil the information be kept confidential, and will it be used for enforcement purposes. The questionnaire and the Rivers and Harbors Act combined may be the means used to force industry to divulge per tinent data in applying for a permit. (Sperling Florida)

MARTIN-TRIGONA V. RUCKELSHAUS (CHALLENGE OF EXECUTIVE IMPOUNDMENT OF FWPCA FUNDS).
1 Pollution Control Guide, Vol 3, paragraph 15023 p 15211-15216, 1973.

Descriptors: *United States, *Government finance, *Administrative agencies, *Administrative decisions, Budgeting, Legal aspects, Administration, Treatment facilities, Construction, Jurisdiction, Decision making, Regulation, Coordination.
Identifiers: *Impoundment, Standing(Legal), Sovereign immunity, Justiciable controversy.

The federal district court ordered the Environmental Protection Agency Administrator to allot among the states all sums designated by Congress for sewage treatment works construction projects approved by the Administrator for federal funding. A private citizen has legal standing to compel the Administrator to expend these sums. Citizen suits are available to compel the Administrator to perform a nondiscretionary act or duty. The doctrine of sovereign immunity as a defense to the courts assertion of jurisdiction is inapplicable in a suit which challenges action by a federal officer that allegedly goes beyond the scope of that officer's statutory power. The sovereign immunity defense can only be asserted when the judgment may force an expenditure from the public treasury. The Administrator's refusal to make a full allotment of appropriated sums produces interests sufficiently adverse, and a legal issue of sufficient immediacy and reality to create a justiciable controversy. (Sperling-Florida)

ENVIRONMENTAL DEFENSE FUND, INC. V. CALLAWAY (SEEKING DECLARATION THAT FINAL ENVIRONMENTAL IMPACT STATEMENT FOR DAM AND RESERVOIR WAS INADEQUATE UNDER NEPA).
97 F.2d 1340 (8th Cir 1974).

Descriptors: *Missouri, *Federal jurisdiction, Judicial decisions, *United States, *Legislation, Reservoir, Standards, Adoption of practices, Construction, Legal review, Law enforcement, Regulation, Governmental interrelations, Economic aspects, Decision making.
Identifiers: *National Environmental Policy Act, Environmental Impact Statements, Declaratory relief(Legal aspects), Injunctive relief(Legal aspects).

This was an action arising out of the United States District Court for the Western District of Missouri seeking declaratory and injunctive relief against the Secretary of the Army. At issue is the sufficiency of the final environmental impact statement for the Army Corps of Engineers' Harry S. Truman Dam and Reservoir Project being built on the Osage River. The district court refused to grant injunctive relief. On appeal the trial court's determination that the environmental impact statement met the standards of the 1969 National Environmental Policy Act was affirmed. The court also affirmed the taxing of costs. The district court assessed the costs against each party up to the date of the first decision that an environmental impact statement was necessary for the project. (Sperling-Florida)

NONSTRUCTURAL MEASURES FOR FLOOD PLAIN AND FLOOD DAMAGE MANAGEMENT, WITH APPLICATION TO THE CONNECTICUT RIVER BASIN SUPPLEMENTAL FLOOD MANAGEMENT STUDY,
Cheney, Miller, Ellis and Associates, Inc., Putnam, Conn.
P. B. Cheney, D. A. Yanggen, P. M. Glick, and H. C. Miller.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238-498, $7.75 in paper copy, $2.25 in microfiche. Prepared for New England River Basins Commission, Boston, Mass. Working paper, February 28, 1974. 182 p, 17 fig, 11 tab, 34 ref. CRSS-NERBC 1.2-4E. NERBC 1.2-4E.

Descriptors: *Planning, *Non-structural alternatives, *Connecticut River, *Flood plains, *River basin development, *Flood proofing, Management, *Land management, Flood control, Flood protection, Flood plain insurance, Water zoning, Building codes, Governments, Legislation, New Hampshire, Massachusetts, Connecticut.
Identifiers: *Flood plain management, New England River Basin Commission.

After identifying the present national flood plain situation and management tools within an institutional framework, Part I of this report details nonstructural techniques for flood management in the Connecticut River Basin and discusses their advantages and limitations along with the effectiveness of existing and proposed programs for nonstructural management at the state level in the basin. A flood plain management system depends upon the area's physical characteristics as well as the weight given to social and environmental objectives. Alternatives to structural works such as flood proofing, urban redevelopment, permanent evacuation, and governmental regulatory measures can control the amount and type of growth which will be subject to flood damage. Passage of national land use policy legislation will provoke the states to implement flood plain management programs. Part II contains the framework for applying information on non-structural measures to actual flood plain situations in the Basin and a discussion of selected examples of non-structural flood management at the community level. The study focuses upon the technical feasibility of the measures, their ability to meet the objectives of flood management and their implications from the standpoint of implementation costs. This framework for regulating flood plains will serve as an aid for developing comprehensive plans for the Connecticut River Basin (Salzman-North Carolina)

6G. Ecologic Impact Of Water Development

ENVIRONMENTAL IMPACT STATEMENTS IN PLANNING WATER AND RELATED LAND RESOURCES,
State Univ. of New York at Syracuse. Coll. of Environmental Sciences and Forestry.
P. E. Black.
Water Resources Bulletin, Vol 11, No 5, p 881-886, October 1975. 2 tab, 18 ref.

Descriptors: *Water resources development, *Planning, *Environment, Land resources, Evaluation, Ecology, Forecasting, Cost-benefit analysis, Cost-benefit ratio, Economics, Water policy, Risks.
Identifiers: *Environmental impact statement, Principles and standards (WRC), Resource use, NEPA, Uncertainty, Multiple objectives.

The history of water and related land resources planning suggests that environmental and economic considerations should be kept separate. Attempts to evaluate 'intangibles' in the benefit-cost analysis and to include economics in environmental evaluation cloud the issue. The benefit-cost analysis is represented by a simple ratio; efforts to balance it by a verbose statement of complex ecological description and environmental interactions does not clarify the problem. The uncertainties of ecological forecasting are no worse than those associated with economic forecasting. A properly constructed environmental impact statement can be effective in planning resource use and can consequently lead naturally to the consideration of a broader range of governmental actions than is presently the case. The impact statement should not be an encyclopedia of the local ecology; rather, it should accurately represent the environment which the action will impact and thoroughly analyze only the potential impacts of the proposed action and its alternatives on that environment. The first step is to develop a 'tiered' approach to policy, programs, projects, and practices involving resources development, so that unnecessary duplication of analysis and reporting is eliminated, and so that each statement deals only with the action, environment, and impact at hand. Impacts may be classified according to importance, magnitude, and probability, etc. (Bell-Cornell)

ENVIRONMENTAL HAZARDS OF LARGE SCALE WATER DEVELOPMENTS,
Geological Survey, Raleigh, N.C.
R. L. Nace.
In: Priorities in Water Management, Western Geographical Series, Vol 8, F. M. Leversedge, ed. University of Victoria, Victoria, British Columbia, p 3-18, 1974. 1 tab, 18 ref.

Descriptors: *Environmental effects, *Dams, *Post impoundment, *Earthquakes, *Impoundments, *Diversion, Environmental engineering, *Africa, Water pollution, Management, Water distribution, Water sources, Water control
Identifiers: River impoundments, Climate modification, North American Water and Power Alliance(NAWAPA), African Sea, Earth wobble, Geostatic loading, Siberian River, Great South American Lakes.

Consequences of water projects on the environment are rarely accounted for in the development and construction of the project. Several examples of unwanted and unforeseen effects such as environmental destruction and disruption, epidemic spread of endemic disease, and economic, social and political disruption of human institutions are documented. River impoundments and diversions emphasize the possibilities of environmental degradation occurring due to lack of policy and planning. Water power proposals often ignore forces that could be set in motion in response to immutable natural laws. Besides modifying landscapes and upsetting local and regional ecology, more drastic effects such as climate changes, earth wobble, and earthquakes caused by geostatic loading imposed usually by large dams and less frequently by reservoirs can result. These environmental effects are caused by irrigation,power production and river impoundments for recreation and water supply. Documented areas affected include the Northern American Water and Power Alliance (NAWAPA), the Siberian River Diversion, the Great South American Lakes project and the African Sea. Knowledge about natural processes is too limited to permit accurate foresight even of local and regional effects, let alone possible continental and global hazards. P. H. Carrigan, Jr., and H. G. Golden.
Available from National Information Service Springfield, Va 22161 as PB-245-190 as $3.50 paper copy, and $2.25 in microfiche. Water Resources Investigations 30-75, September 197 25 p, 8 fig, 7 tab, 9 ref.

Descriptors: *Stream gages, *Streamflow *Network design, *United States, *Compute models, Data collections, Operations research Streamflow forecasting, Gaging stations, Optimization, Correlation analysis, Streams, Illinois Georgia, Montana.
Identifiers: Mixed integer programming.

Networks of small stream (less than 50 sq mi gages have been operated by the Geological Survey throughout the country for a number of years to supplement flood information for large streams The goal in operation of these networks has been to obtain sufficient data for estimating flood frequency at ungaged sites with the equivalent accuracy expected from 10 years of observed flood records. Most networks have accumulated sufficient data to satisfy these accuracy requirements A review is made of these data for possible reduction of the number of gages in the networks Thomas Maddock in 1974 developed a rational method for selecting gages to be retained in a reduced hydrologic network. This method of network analysis will result in selecting the optimum set of gages retained for a given level of annual operating costs with the information content of the reduced network being the factor optimized. Maddock's method of analysis is described and its use described in detail for a hypothetical network in Illinois, Georgia, and Montana. (Woodard-USGS)

REMOTE SENSING TECHNIQUES FOR EVALUATION OF SOIL WATER CONDITIONS.
South Dakota State Univ., Brookings. Remote Sensing Inst.
F. A. Schmer, and H. D. Werner.
Transactions of the ASAE (American Society of Agricultural Engineers) Vol 17, No 2, p 310-314 March-April 1974. 6 fig, 3 tab, 8 ref.

Descriptors: *Remote sensing, *Soil moisture *Grain sorghum, Films, Filters, Infrared radiation, Wavelength, Reflectance, Irrigation, Agriculture, Irrigation practices, Soil water, *Water analysis, Evaluation.

dentifiers: *Multispectral imagery, *Crop anopy, *Spectral bands.

The results of two years of soil water research indicate that remote sensing did provide a valuable tool in evaluation of soil water condition for the crop and soils studied. Multispectral data collection and analysis seem to hold the key to the development of the necessary remote sensing techniques for operational use. Results indicate that early season soil water conditions with little crop cover of the soil were best monitored with the blue spectral band. As the season progressed and the crop canopy developed, the sorghum became an indicator of the available soil water; and the green and red spectral bands became more useful with red the best of all. Adjusting the film densities from the reflected imagery to account for variations in incoming radiation provided improved results in several cases. Thermal infrared radiation may possibly be the most valuable tool for widespread soil water evaluation since it seems less affected by difference in vegetative and soil surfaces. (Skogerboe-Colorado State)

SOIL TEMPERATURE MODELING USING AIR TEMPERATURE AS A DRIVING MECHANISM,
Wyoming Univ., Laramie. Dept. of Civil Engineering.
V. R. Hasfurther, and R. D. Burman.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 17, No 1, p 78-81, January-February 1974. 6 fig, 1 tab, 1 append.

Descriptors: *Model studies, *Mathematical models, *Soil temperature, *Air temperature, Temperature, Climatic data, Agriculture, Forecasting.
Identifiers: *Soil temperature modeling.

A mathematical model for predicting soil temperature from air temperature is developed and should have great utility because of the availability and economy of air temperature measurements as compared to soil temperature measurements. The mathematical model will predict daily average soil temperatures within approximately three degrees Farenheit at depths of from 1 inch to 72 inches based on past measurements of average daily air temperature as reported by a standard weather bureau shelter. Prediction of future soil temperatures is largely limited by the accurate prediction of air temperatures in advance. The results of the mathematical modeling technique show that the deviations of predicted values from the actual values (smoothed values) were usually within three degrees and more often than not were less than three degrees in error. CONTROLLING CENTER PIVOT SPRINKLERS FOR EXPERIMENTAL WATER APPLICATION,
Agricultural Research Service, Fort Collins, Colo.
D. F. Heermann.
Presented at 1974 Winter Meeting of the American Society of Agricultural Engineers, December 10-13, 1974. Chicago, Illinois. Paper No 74-2552, American Society of Agricultural Engineers. St. Joseph, Michigan, 23 p, 7 fig, 7 tab.

Descriptors: *Sprinkler irrigation, *Research equipment, Data collections, Application equipment, Application methods, Irrigation methods, *Irrigation practices, Irrigation, Farm management, Management, Water control, *Control systems.
Identifiers: Center pivot sprinklers.

Irrigation systems and techniques are often required for various water treatments for water management research. Center pivot irrigation systems were successfully modified to vary water application depths on droplet size on small plots or entire sectors. The modifications included controls for varying travel speed and for automatically starting and stopping individual sprinkler heads. The modifications made on center pivot systems for three different experiments were successfully used for applying water treatments. When systems were run at constant rotation speeds, the coefficient of variability was generally less than 20%. Water treatments applied with center pivot systems required minimal labor since the systems were designed to automatically effect the desired treatments as the systems passed over the plot areas. MECHANICAL SNAKE RIVER UNDISTURBED SOIL CORE SAMPLER,
Agricultural Research Service, Kimberly, Idaho. Snake River Conservation Research Center.
C. W. Hayden, and C. W. Robbins.
Soil Science, Vol 120, No 2, p 153-155, August 1975. 3 fig, 1 ref.

Descriptors: *Soil investigations, *Core drilling, Hydraulic conductivity, Power head, Sampling, Tubes, Mechanical equipment, Soils.
Identifiers: *Mechanical sampler, *Snake River Sampler, Undisturbed sampling, Power-driven sampler, Cutting tip, Split sleeve, Hand operation, Auger tubes.

The hand-operated Snake River Sampler for obtaining undisturbed soil cores in the upper 50 cm of soil was reported in 1968. Described here was a newer sampler which had the ability to sample bedrock at a depth of 5 m by adding an outside auger tube without having to pull the entire sampling equipment out of the soil. A direct-drive 9 hp gasoline motor with a centrifugal clutch powered the drilling unit. A cutting tip permitted an inside sample tube to remain stationary while the outside auger tube removed the soil away from the sample. The sample tube and split sleeve holder had a slightly larger diameter than the spring steel cutting tip. This allowed the sample to slip into the split sleeve holder without any distortion or compaction. The dimensions described were optional, and it would be advisable to use a larger power unit if sampling to greater depths were necessary. The unit could be converted to, or mounted on, a small trailer. This made the sampler highly maneuverable for sampling in areas where larger units could not operate. Difficulty could be encountered in sampling very dry or gravelly soils. (Roberts-ISWS)

CLASSIFYING STORM RUNOFF POTENTIAL WITH PASSIVE MICROWAVE MEASUREMENTS,
Agricultural Research Service, Chickasha, Okla.
B. J. Blanchard, J. W. Rouse, Jr., and T. J. Schmugge.
Water Resources Bulletin, Vol 11, No 5, p 892-907, October 1975. 3 fig, 3 tab, 23 ref.

Descriptors: *Storm runoff, *Microwaves, Soils, Watersheds(Basins), Soil moisture, Vegetation, Soil texture, Runoff coefficient, Remote sensing, Runoff, Measurement, Hydrology.
Identifiers: *Storm runoff potential, *Microwave measurements, Surface roughness, Vegetative cover, Watershed runoff, Microwave imaging.

The average microwave temperature of the watershed surface as detected by an airborne Passive Microwave Imaging Scanner (PMIS) was compared with the measured Soil Conservation Service (SCS) watershed storm runoff coefficient. Previous laboratory work suggested that microwave response to the watershed surface was influenced by some of the same surface characteristics that affect runoff, i.e., soil moisture, surface roughness, vegetative cover, and soil texture. In order to field test and develop relations between runoff potential and microwave response, several highly instrumented watersheds of approximately 1.5 to 17 sq km were scanned under wet- and dry-soil conditions in April and June 1973. The polarized (horizontal and vertical) scans at 2.8 cm wavelength provided the data base from which other values were calculated. The best relationship between runoff coefficients and PMIS temperatures was observed when horizontally polarized temperatures from the near-dormant, early-growing season flight were used. Lower SCS runoff coefficients seemed to be correlated with the cross-polarized response under dry watershed conditions late in the growing season and the difference in horizontal polarized response between wet conditions early in the growing season and dry conditions late in the growing season. INVENTORY OF POTENTIAL AND EXISTING UPSTREAM RESERVOIR SITES, TAUNTON AND NARRAGANSETT BAY STUDY AREAS.
Soil Conservation Service, Amherst, Mass.
USDA and Massachusetts Water Resources Commission, January 1974. 194 p, 41 fig, 17 tab, 11 ref, append.

Descriptors: *Reservoir sites, *Reservoirs, *Potential water supply, *Massachusetts, Safe yield, Artificial lakes, Feasibility studies, Hydraulic structures, Hydrology, Cost analysis.
Identifiers: *Reservoir site inventory, *Narragansett Bay, *Taunton Bay, Reservoir costs.

Data on 81 potential and 160 existing reservoirs were presented. One of a series dealing with reservoir sites in Massachusetts dating back to 1965, the study covers a 699 sq mi area divided into 16 subwatersheds. The selection criteria for potential reservoir sites, including drainage areas between 0.5 and 50 sq mi, were documented. Sites were located on 7.5-minute quadrangle maps. A field reconnaissance was made at each site to determine the potential effects on man-made structures. An approximate total development cost was made for each site based on 1972 land values. Surficial geologic investigations were also made at each potential reservoir site. The hydrologic and hydraulic studies provided type of principal spillway, the 100-year peak flow, and the safe yield of the reservoir for water supply purposes. Maps showing the location of each potential and existing reservoir as well as their respective drainage areas were presented for each subwatershed. For each existing reservoir, a field reconnaissance was made to determine the physical condition of the structure and to assess the potential for expansion. Selected photographs were included, as well as information on ownership and use. (Terstriep-ISWS)

ADAMS COUNTY SURFACE WATER RESOURCES,
Illinois Dept. of Conservation, Springfield. Div. of Fisheries.
B. Dunn.
December 1972. 64 p, 16 fig, 14 tab, 26 ref.

Descriptors: *Water resources, *Surface waters, *Illinois, *Data collections, Water pollution, Streams, Lakes, Climates, Geology, Drainage, Soils, Impoundments, Ponds, Water quality, Fisheries, Fish Recreation, Sport fishing, Commercial fishing, Boating, Public access, Hunting, Reservoir sites, Water levels.
Identifiers: *Adams County(Ill).

Adams County, located in west-central Illinois along the Mississippi River, is 866 sq m in area. It has a population of 68,467 people, two-thirds of which reside in Qunicy. With the exception of industrialized Quincy, the county is agriculturally oriented. The climate is generally mild with an average annual temperature of 55F. Precipitation averages 35-36 in annually. Water resources total approximately 2267 artificial impoundments (1533.8 acres), 35 natural lakes (840.8 acres), and 24 streams (625.5 acres). There are numerous pond and lake sites for potential recreational development. Nineteen potential lake sites have been proposed as feasible and an additional eight have been included in the McKee Creek Watershed Project. Recreation is generally centered along the Mississippi River where approximately 16,100 acres of water are open to public use. Siloam Springs State Park is also heavily used. Sales of fishing and boating licenses have increased in the past few years, but hunting licenses sales have dropped due to the 1968 gun owners registration law. Water quality is generally good; pollution problems are not serious, although there are problem areas. Only one fish kill (undetermined origin) has been reported in recent years. Agricultural problems of soil erosion, pesticides, and animal wastes probably present more of a potential threat than industrial and municipal wastes. Development of recreational areas within the county seems promising. (Robinson-ISWS)
W76-01317

HENDERSON COUNTY SURFACE WATER RESOURCES,
Illinois Dept. of Conservation, Springfield. Div. of Fisheries.
K. Russell.
December 1971. 86 p, 15 fig, 17 tab, 51 ref, 3 append.

Descriptors: *Surface waters, *Water resources, *Illinois, *Data collections, Streams, Lakes, Ponds, Impoundments, Rivers, Mississippi River, Drainage, Soils, Climates, Geology, Fish, Fishing, Sport fishing, Commercial fishing, Recreation, Boating, Hunting, Wildlife, Water quality, Water pollution, Thermal stratification, Damsites, Water levels, Public access.
Identifiers: *Henderson County(Ill).

Henderson County, located in northwestern Illinois with a land area of 381 sq mi, is essentially separated into three distinct regions: A flat to undulating upland plain, a rugged bluff region, and the low-lying Mississippi River plain. The climate is characterized by a very wide range in temperature and an abundant rainfall. Surface drainage is divided by the Mississippi and Illinois River systems, but the latter drains only 15 sq mi in the extremed southeast corner of the county. The current surface water inventory of Henderson County, which includes all major streams and impoundments, is 12,753.7 acres or 5.2% of the total land area. The Mississippi River on the Henderson County side of the main channel has a total length of 36.4 miles with an area of 11,342.8 acres. On a acreage basis, approximately 54% of the 996 acres of impounded surface water is classified under private ownership. New Crystal Lake, with its 375 acres of marsh and open water, is the largest single surface water impoundment and is operated as a hunting and fishing club. Gladstone Lake, operated by the Illinois Department of Conservation, is the only public impoundment offering multiple use water oriented recreation. Henderson Creek is the major stream, draining approximately 583 sq mi in west-central Illinois. Boating, fishing and hunting are the most popular water-based sports. The future of Henderson County's surface water resources requires careful management of the existing surface waters so the greatest use of their potential can be realized. (Robinson-ISWS)

INSERTION OF POLYETHYLENE PIPE RENEWS DAMAGED SEWER,
Montgomery Water and Sanitary Sewer Board, Ala.
N. P. Wiley.
Public Works, Vol. 104, No. 2, p 64-65, February, 1973. 5 fig.

Descriptors: *Plastic pipes, *Sewers, Plastics, Concrete pipes, Damages, Costs, Repairing, Pipes.
Identifiers: Polyethylene pipe.

A 22-inch polyethylene pipe lining has been used to renew a 24-inch reinforced concrete gravity sewer main damaged by hydrogen sulfide. The damaged portion of the main extended 754 feet in a straight line and veered at a 45 degree angle for an additional 96 feet. Added to the cost and inconvenience of replacement were the factors of infiltration of storm water and exfiltration of sewage into the surrounding terrain. Since the flow rate of the mentioned polyethylene pipe was the same as that for the damaged sewer, the polyethylene lining developed by the Du Pont Company was used for repairs. The three pipe sections were pulled by a winch, operating through a manhole on the upgrade of the run, into position at a rate of 30 to 40 feet per minute. The house laterals were then connected to the plastic pipe by inserting 4-inch polyethylene pipe through the old concrete lines and making house connections into the repaired main through the use of remote connector fittings. The entire job afforded a savings of about $10,000. (Sandoski-FIRL)

WATER RESOURCES ASPECTS OF THE PROPOSED PERKINS STATION NUCLEAR POWER PLANT.
North Carolina Dept. of Natural and Economic Resources, Raleigh. Water Resources Planning Dept.
Technical Report No IV-21-C (N0 1), North Carolina Water Plan, Area Management Plans, The South Atlantic Gulf Region, Yadkin-Pee Dee River Basin, 1974. 69 p, 18 tab, 1 map, 10 plates, 21 ref.

Descriptors: *Nuclear powerplants, *Water resources, *North Carolina, Hydrologic aspects, Withdrawal, Consumptive use, Low flow, Downstream, Water quality, Streamflow, Water resources development, Management, Hydrology, Recycling, Analysis, Sites, Discharge(Water), Waste disposal, Industrial wastes, Effluents, Water pollution.
Identifiers: *Perkins Power Plant, *Yadkin River(NC), Water resources management, Downstream use, Alternative sites.

A study was conducted to evaluate the potential effects of Duke Power Company's proposed Perkins Nuclear Station on the Yadkin River in Davie County, North Carolina, and to investigate 14 alternate sites. Intensive hydrological studies were performed and effects on water quality were investigated. The Yadkin-Pee Dee River is a valuable natural resource in North Carolina, and is considered more important to future industrial development than any other stream in the state. The Yadkin River, particularly in the vicinity of the Yadkin College gage, is less affected by drought conditions than other large streams of North Carolina. It is a dynamic and dependable river which should have formed the backbone of future comprehensive water resources planning in the Piedmont Region. As proposed, the Perkins Nuclear Station would withdraw water from the Yadkin River when the flows were above 330

LIBRARY U. OF I. URBANA-C

cubic feet per second (cfs). Withdrawals would be in the range of 50-315 cfs. During more critical conditions about 110 cfs of the water withdrawn would be consumed by evaporation, reducing the total river flow about 50%. The study was directed toward determining what conditions should be placed on the operation of the Perkins Station in order to minimize its effects on the state's water resources and what suitable alternative sites may be available. NEEDS AND PLANS IN THE DEVELOPMENT OF URBAN AND RURAL SEWER SYSTEMS (POTRZEBY I PLANY ROZBUDOWY SIECI KANALIZACYJNEI W MIASTACH I OSIEDLACH),
J. Klossowski.
Gaz, Woda i Technika Sanitarna, Vol 47, No 1, p 20-21, 1973. 4 tab.

Descriptors: *Planning, *Sewerage, Population, Pipelines, Water, Installation.
Identifiers: Poland.

The size and investments required for urban and rural sewer system installation and/or expansion in Poland have been announced after statistics of the 1965-1970 five-year plan were tabulated. Data for the 1975-1985 period in terms of sewer length per inhabitant as related to the size of the settlement population are projected. Investment requirements are broken down over three periods, including 1970-1975, 1976-1980, and 1981-1985, according to pipeline length requirements and pump over costs- about 10 percent of that for sewage network installation. Theoretically, sewage system planning and development constitutes an integral part of their housing development and the sewage system pipeline length should accomodate all who receive public water. (Sandoski-FIRL)

DEVELOPMENTS IN TRENCH-TYPE TUNNEL CONSTRUCTION,
Palmer and Baker Engineers, Inc., Mobile, Ala.
W. F. Palmer, and K. C. Roberts.
Journal of the Construction Division, American Society of Civil Engineers, Proceedings paper No 11183, Vol 101, No CO1, p 37-49, March 1975. 8 fig.

Descriptors: *Underwater, *Construction, *Tunneling, *Tunnels, *Excavation, History, Foundations.
Identifiers: *Trench-type tunnels.

The basic concept of the subaqueous trench-type tunnel dates back to antiquity. It is known that a tunnel of this type was constructed in Babylon in 2180-2160 B.C. The modern revival of this old idea dates from before 1854. A review is presented of the various methods of construction proposed in the years following, culminating in the construction of the first true trench-type tunnel, the Detroit River Tunnel of the Michigan Central Railroad (1906-1910). Construction of this tunnel and other early tunnels--i.e., the Posey Tube, Alameda (1926-1928), The Detroit-Windsor Tunnel (1928-1930), the Bankhead Tunnel, Mobile, Ala. (1939-1940), and the Maas River Tunnel (1938-1941)--is described in general terms. The inherent advantages of trench-type tunnels were demonstrated in these early works and led to the widespread use of this kind during the ensuing years. (Bell-Cornell)

ZUMBRO RIVER BASIN, MINNESOTA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, St. Paul, Minn.
Available from National Technical Information Service, Springfield, Va 22161 as EIS-MN-73-1524-F, $5.00 in paper copy, $2.25 in microfiche September 19, 1973. 87 p, 3 map.

Descriptors: *Channel improvement, *Levees, *Flood control, Turbidity, Birds, Mammals, Environmental effects, Fish, Channels, Flood plain insurance, Flood protection, Floods, Flood plains, Environment, Flood proofing, Reservoir storage, *Minnesota.
Identifiers: *Environmental Impact Statements, *Rochester(Minn)

The project entails approximately 10 linear miles of channel modification on the South Fork Zumbro River, Bear Creek, and Cascade Creek in Rochester, Minnesota, with supplementary levee and pump station construction, flood proofing of municipal buildings, and regulation of the remaining flood plain areas. The environmental impact of the flood control plan would most importantly result in flood protection for the residents of Rochester. The savings from flood damages balance against the disruption to the greenbelt corridors and loss of natural riverine habitat over a distance of 10 linear miles. A net loss to the aesthetics of the human environment is also likely to result. Other adverse environmental effects include turbidity of water during construction; disruption of community affairs; relocation of two residences and eight businesses; and disruption of riparian and aquatic ecosystems with reduction of bird, mammal, and fish populations attendant from loss of habitat. Alternatives include flood proofing of existing and new structures; flood warning systems; permanent evacuation; flood insurance; flood plain regulation; large reservoir storage; headwater reservoir storage and improved land management practices; channel improvements and levees; and considerations of these measures. Comments were received from the Environmental Protection Agency, Department of Interior, and the Sierra Club among other institutions. (Gagliardi-Florida)

BAYOU BODCAU AND TRIBUTARIES, ARKANSAS AND LOUISIANA ASSOCIATED WATER FEATURES, RED RIVER, BAYOU BODCAU, FLAT RIVER, RED ETC....(FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, New Orleans, La.
Available from National Technical Information Service, Springfield, Va 22161 as EIS-LA-73-1764-F, $4.50 in paper copy, $2.25 in microfiche. November 8, 1973. 84 p, 5 fig, 6 tab.

Descriptors: *Flood control, *Flood protection, *Flood frequency, *Construction, Fish, Wildlife, Wildlife habitats, Habitats, Forestry, Flood plain zoning, Flood plain insurance, Arkansas, Louisiana.
Identifiers: *Environmental Impact Statements, *Bayou Bodcau(Ark-La).

The project provides for the construction of a comprehensive flood control plan in the Bayou Bodcau, Flat River, Red Chute Bayou, and Loggy Bayou Basin. The plan creates flood protection against a headwater flood having a frequency of occurrence of 25 years. Construction of the recommended features all require physical alteration to segments of various bodies and will impose changes in use on some land areas. There will be adverse effects on the fish, wildlife, and forestry resources because of actual construction of project features and a result of changes in land use in the area to be protected. Many structural and nonstructural alternatives were considered including dams and reservoirs, modification of the Bayou Bodcau Reservoir, flood plain zoning, flood plain insurance, and payment or evacuation. (Denvir-Florida)

SAINT FRANCIS BASIN PROJECT, ARKANSA AND MISSOURI, (ENVIRONMENTAL IMPAC STATEMENT).
Army Engineer District Memphis, Tenn
Available from the National Technical Informa tion Service, Springfield Va 221 as EIS MO-7 1946 F, $9.00 in paper copy $2.2[illegible] in microfich December 17, 1973. 266 p, 4 plta, 13 tab, 2 append

Descriptors *Environmental effects, *Flood rou ing, *Detention reservoirs *Missouri *Arkansa Reservoirs Reservoir construction, Flood co trol, Drainage, Levees, Flood protection Chec structures, Control structures, Multiple-purpo reservoirs, Water management(Applied Aesthetics, Natural resources, Recreation, Publ health, Agriculture, Fish, Water birds, Waterfow Wildlife habitats, Groundwater basins, Feder government.
Identifiers: *Environmental Impact Statement *Dam effects.

The project involves the completion of a reservo in the Ozark foothills in southeast Missouri an channel improvements, and control structures i the alluvial valley in southeast Missouri an northeastern Arkansas. Predominate portions t be affected are rural, agricultural areas in a fl basin which has experienced frequent floodin Projected impacts of the project involve a redu tion in the frequency and duration of flooding wi resultant economic growth, improvement of ou door recreation, reduction of health hazards, an mitigation of fish and wildlife losses. Adverse e vironmental effects include increases in strea turbidity, reduction in fishery values, impairme of aesthetics, disruption of the benthic commun ty, loss of wildlife and windscreens because o removal of vegetation, erosion, and potential po lution. Less feasible alternatives considered wer (1) additional reservoirs, (2) floodplain manag ment-zoning, (3) acquisition of flowage eas ments, (4) no action, and (5) discontinuance o maintenance. The present generation will sacrifi a variety of natural resources to gain long-ter agricultural uses. Changes in land use will no bring about permanently irreversible commitmen of the environmental resources, but the diversit of uses will be reduced. Comments generally ex pressed concern over loss of outdoor recreation and harm to wildlife. (Fernandez-Florida)

ON THE MINIMUM SIZE OF NATURAL DRAFT DRY COOLING TOWERS FOR LARG POWER PLANTS,
Cornell Univ., Ithaca, N.Y. Energy Project.
F. K. Moore.
Available from the National Technical Informa tion Service, Springfield, Va 22161 as PB-227 81 $4.00 in paper copy, $2.25 in microfiche. Paper N 72-18, August 1972. 32 p, 6 fig, 2 tab, 8 ref. NS GI-34776.

Descriptors: *Cooling towers, *Engineering struc tures, *Powerplants, Electric powerplants, Hea transfer, Cooling, Evaporation, Water cooling Engineering, Reynolds number, Froude number Design standards.
Identifiers: *Natural draft cooling towers, Dr cooling towers, Minimum size.

nple scaling law was derived which relates shape, drag coefficient and performance for al-draft dry cooling towers. The tower was ed as a gasdynamic duct, and the flow was zed by a perturbation theory for small tem- ure differences and flow Mach numbers. For drag, temperature performance, and duct atio, height was inversely proportional to the e of flow area. Adapting standard heat- nger design relationships and postulating a olds' analogy connecting friction and heat er, drag and performance were related to other, and the gasdynamic scaling law. A unction' was found, which has a minimum at icular air exit temperature, for a given water mperature. Thus, technical requirements for um size were derived. Absence of water- esistance, full counterflow equivalence and um 'size function' helped to define this um. Open-ended possibilities are the reduc- f fruction factor, and especially, increase of e exchanger entrance area, which can fully reduce drag and hence improve draft. -ISWS)

FLOATABLE BREAKWATER,
R. B. Fuller
U.S. Patent No 3,863,455, 3 p, 11 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 931, No , p 73, February 4, 1975.

Descriptors: *Patents, *Breakwaters, *Shore protection, Ocean waves, Erosion, Beach erosion.
Identifiers: *Wave action.

A floatable breakwater comprises a flexible tubular element supported upon a number of water buoyant rings at the surface of the water so that the envelope can be filled with water. Both ends of the envelope are open and have drawstrings attached thereto which in turn are anchored to secure the breakwater in position. The envelope has sufficient flexibility to enable the rings to move with respect to each other in an accordian-like movement. The breakwater is positioned in the water with its longitudinal axis angularly dispused to the direction of the wave movement and floating at such a depth that the breakwater will be filled with water through its open ends so as to be extendable and contractable axially by the relative movement of the annular members within the envelope when the breakwater is acted upon by waves. (Sinha-OEIS)

PREDICTION OF FLOW DEVELOPMENT ON SPILLWAYS,
Karlsruhe Univ. (West Germany). Institut fuer Hydromechanik.
R. J. Keller, and A. K. Rastogi.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY9, Proceedings Paper No 11581, p 1171-1184, September 1975. 9 fig, 1 tab, 21 ref, 2 append.

Descriptors: *Spillways, *Numerical analysis, *Boundary layers, *Air entrainment, Open channel flow, Turbulence, Hydraulics, Hydraulic structures, Design, Design flow, Velocity, Flow resistance, Roughness(Hydraulic), Aeration, Mathematical models.

A mathematical model for the flow development upstream of the region of air entrainment on a spillway was developed. The model was based on numerical solutions of the time-averaged two-dimensional form of the Navier-Stokes equations. Predictions from the model of mean velocity distributions, boundary layer growth, and water surface profiles were compared with experimental data, both model and prototype. Excellent agreement was obtained. Furthermore, it was shown conclusively that self-aeration in a spillway flow commenced at the point where the bed induced turbulence reached the free surface. (Adams-ISWS)

CHARACTERISTICS OF A CIRCULAR JUMP IN A RADIAL WALL JET,
Asian Inst. of Tech., Bangkok (Thailand). Div. of Water Resources Engineering.
A. Arbhabhirama, and W. C. Wan.
Journal of Hydraulic Research, Vol 13, No 3, p 239-262, 1975. 14 fig, 5 ref, 1 append.

Descriptors: *Jets, *Hydraulic jump, *Energy dissipation, *Boundary layers, *Supercritical flow, Theoretical analysis, Laboratory tests, Reynolds number, Froude number, Flow, Subcritical flow, Velocity, Turbulent flow, Mathematical studies.
Identifiers: *Radial wall jet, Circular hydraulic jump.

The flow resulting from an axisymmetric jet impinging on a smooth horizontal flat surface is called a radial wall jet. When supercritical radial flow changes to subcritical flow in this jet, a circular hydraulic jump is formed. This can be used as an energy dissipator. Expressions for the energy dissipation and location of the jump were derived for a steady, incompressible and uniform flow, neglecting friction forces on the boundaries and assuming hydrostatic pressure distributions. The experimental verification was done using diesel oil and nozzle diameters varying from 1 to 3.75 inches for the Reynolds number in the range of 10,000 to 80,000. The experimental results satisfactorily verified the theoretical characteristics of the radial wall jet and circular hydraulic jump. The boundary layer, which developed outward from the stagnation point of the jet, had important effects on the radial flow profile. (Singh-ISWS)
W76-01267

CONSTRUCTION OF A SPILL CHANNEL AND EXPERIMENTAL DETERMINATION OF SPILL SPREADING RATES OF FOUR NON-HAZARDOUS CHEMICALS ON WATER.
Lowell Technological Inst., Mass. Dept. of Mechanical Engineering.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-237 491, $4.50 in paper copy, $2.25 in microfiche. Report No DOT/TST-75-18, March 1974. 53 p, 32 fig, 18 ref. DOT-OS-30109.

Descriptors: *Oil spills, *Laboratory tests, *Open channels, Waves(Water), Steady flow, Velocity, Hydraulic models, Laboratory equipment, Instrumentation, Measurement, Photography, Path of pollutants, Data collections, Water pollution sources.
Identifiers: *Spill channels, Spreading rates, Soybean oil, Tetrahydronaphthalene, Dicotyl phthalate, 1-hexadence, Wave generator.

An experimental study of the spill spreading rates of various representative hazardous, nonmiscible liquids on water was reported. These liquids were soybean oil, tetrahydronaphthalene, dioctyl phthalate, and 1-hexadence. A 40-foot spill channel was constructed in which various wavelength and period waves could be generated. The spill fluids were released at several different steady, controlled rates upon the water surface, with and without waves present. The resultant spill was photographed using timed motion picture photography. The spill spreading rate was studied as a function of spill fluid viscosity and density, spill release rate, and water surface conditions. Non-generalized results suitable for spill spread rate prediction were given. Recommendations for additional study were listed. (Humphreys-ISWS)

TURBULENCE MEASUREMENT OF A FLOW WITH SUSPENDED SOLID PARTICLES,
Gifu Univ., (Japan). Dept. of Civil Engineering.
S. Komura, and M. Kubota.
Water Resources Bulletin, Vol 11, No 5, p 871-880, October 1975. 8 fig, 1 tab, 15 ref.

Descriptors: *Turbulence, *Turbulent flow, *Laboratory tests, *Suspended solids, Eddies, Flumes, Roughness(Hydraulic), Measurement, Anemometers, Instrumentation, Hydraulics, Sediments.
Identifiers: *Hot-film probe, Macroscale.

Data on turbulence properties of flow with suspended solid particles were collected, analyzed, and reported. The turbulence data were collected using a quartz-coated, wedge-shaped hot-film probe in a laboratory flume with Toyoura sands as the solid particles. Results of these experiments indicated that the relative intensity of turbulence near the flume bed was less with suspended solid particles than with no suspended solid particles. It was observed that the

LIBRARY U. OF I. URBANA-CHAMPAIGN

macroscale of eddy decreased as the mean cross-sectional suspended sediment increased, and the ratio of decreasing macroscale of eddy to increasing suspended sediment concentration was large. A relationship was also developed between relative sediment concentration and the relative intensity of turbulence. (Bhowmik-ISWS)

BARRON COUNTY'S TRIPLE-THREAT HYDRAULIC BACKHOE.
Public Works, Vol 104, No 4, p 95-96, April, 1973. 2 fig.

Descriptors: *Construction equipment, *Construction, Soils, Storm drains, Sewers.
Identifiers: Barron County(Wisconsin), Hydraulic backhoe.

A Drott Model 40YR Cruz-Air hydraulic backhoe, equipped with two interchangeable buckets, a 60-inch bucket, and a Drott 4-in-1 bucket reduced project costs, cut machine rental expenditures, and saved time on various assignments in Barron County, Wisconsin. The Cruz-Air is used in digging test holes for sand and gravel deposits as well as trenching, placing pipes, and backfilling on storm sewer tasks. It can dig and load back-run gravel and sand, lift and place pilings and timbers, and prepare final grades for curbs, gutters, or sidewalks with accuracy within 1/2 inch. This machine has replaced a tractor backhoe, a crawler crane, and a front-end loader. (Sandoski-FIRL)
W76-01291

SUBMERSIBLE LIFT STATIONS CUT PUMP MAINTENANCE COSTS.
Water and Sewage Works, Vol 122, No 8, p 64-65, August, 1975.

Descriptors: *Pumps, *Sewage treatment, *Sewerage, *Waste water treatment, *Maintenance costs, Operating costs, Monitoring, Control systems, Sewer systems, California.
Identifiers: *Submersible pumps, Foster City(Calif).

Of 34 lift stations handling sewage for Foster City, California, 24 have recently been converted to the submersible pump type. About ten years ago, when the first pumping stations were installed in the city, types of stations included wet well with shaft-driven pumps, wet well/dry well, pneumatic ejector, and submersible. Maintenance and repair costs were high, and the majority of the pumps were difficult to remove for inspection or service. Moisture seeping into motors was a main problem. Since the installation of new Flygt submersible pumps, maintenance costs have been lowered considerably. Well structures have been modified and precise records are being kept on all stations and pumps. Semi-annually, each pump is removed from service and inspected. The pumps are washed and sandblasted down to bare metal, then exterior surfaces are recoated with bitumastic epoxy. This coating is necessary each six months to protect against corrosion from the high salt content of the waste water. Each submersible lift station has two or three pumps, so that at least one is available when the other is removed for maintenance work. An automatic control system for the sewage handling equipment pinpoints conditions at each pumping station and warns when there is a high liquid level in any well. Emergency generators are also available in the case of power failure (Kramer-FIRL)
W76-01460

QUICK RELEASE SAFETY TRAP,
J. C. McIlroy.
United States Patent 3,908,208. Issued September 30, 1975. Official Gazette of the United States Patent Office, Vol 938, No 5, p 2010, September, 1975. 1 fig.

Descriptors: *Waste water treatment, *Patents, *Pipes, *Construction materials, Plastic pipes, Equipment.

A quick release trap for connecting waste water return plumbing lines has been patented. An arcuately curved pipe bend portion is described, having a pair of upwardly opening leg portions, sized to receive a corresponding one of a pair of downwardly pointed pipes. Each leg portion has several segmented and frangible end portions. Each respective leg portion is attached to its opposed pipe by a pair of engageable clamps. A threaded fastener is used to tighten each clamp and secure the tight attachment. The bend portion and leg portions are constructed of a high density polyethylene substance; light is therefore admitted through their walls so that a visual inspection of the condition of the pipe bend is possible before removal for cleaning. Each leg portion is readily detachable from its opposed pipe, and a water hose or other cleaning instrument may be inserted to remove or dislodge clogging material from the bend portion. SACRAMENTO RIVER BANK PROTECTION PROJECT, CALIFORNIA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Sacramento, Calif.
Available from National Technical Information Service, Springfield, Va 22161 as EIS-CA-73-1046-F, $5.50 in paper copy, $2.25 in microfiche. November 1972. 118 p.

Descriptors: *Levees, *Erosion control, *Flood protection, *Bank protection, Flood plains, Vegetation, Reservoirs, Erosion, Floods, Fish, Reservoir storage, *California, Flood control, Environmental effects, Flooding wildlife, Berms, Recreation, Aesthetics.
Identifiers: *Environmental Impact Statements, *Collinsville(Calif), Chico(Calif).

The proposed project entails construction of levee protection and erosion control works along the Sacramento River and its tributaries from Collinsville to Chico, California. The project will safeguard extensive areas in the Sacramento River flood plain from potential widespread damage and loss of life due to flooding. Protection of the le will result in loss of riparian vegetation and sociated fish and wildlife, recreation and sc values. The maintenance practices will also re in removal of vegetation on a regular basis bank protection program and accompanying m tenance will prevent the continuing erosio levees and loss of riparian lands and vegeta The primary adverse environmental effect is loss of aesthetic, wildlife and other natural ri an values. Such values would ultimately be lo erosion if the project is not constructed. Alte tives considered include levee setbacks, rev levee encroachment standards, construction o ditional reservoir storages, construction of berms, further bank and berm protection, deferring or terminating the work. An 8.5 meter long apparently undisturbed from a hilltop on the crest of the East Pacific has uranium and thorium isotope distributions are very unusual. The core is very poor in Tho 232, and rich in uranium, particularly at the centimeter level, where a value of about 150 p per million is reached. At the same depth Thorium 230XS reaches very large nega values. These facts could be accounted for if assumes that solutions rich in uranium and po thorium had been predepositionally injected the sediments about 90,000-110,000 years ago. top of the sediment received much of its ura from seawater, judging from the Ura 234:Uranium 238 ratio. Possibly carbonate solutions were the carriers of the injected u um. (Kemp-Vanderbilt)

GENERALIZED GEOLOGIC FRAMEWORK THE NATIONAL REACTOR TESTING S TION, IDAHO,
Geological Survey, Reston, Va.
R. L. Nace, P. T. Voegeli, J. R. Jones, and M. Deutsch.
Supt. of Documents, GPO, Wash. D. C. 2 Price $2.90. Professional Paper 725-B, 1975. 4 10 fig, 10 tab, 21 ref.

Descriptors: *Hydrogeology, *Engineering ge gy, *Geological surveys, *Nuclear react *Idaho, Planning, Construction, Geologic u Geologic formations, Stratigraphy, Sampl Core drilling, Core logging, Sedimentol Geology, Water supply, Groundwater, W disposal, Nuclear wastes.

The Geologic framework of the NRTS (Nati Reactor Testing Station), Idaho, controls amount and availability of the water supply, methods and efficiency of obtaining water, and behavior of waste materials that are disposed o the ground and beneath the land surface.

nework also affects the selection of construc- sites and the operation of reactors and other lities. Basalt of the Snake River Group of ternary age is exposed in about three-fourths he station area. The basalt, typically gray to k, blusih-black, brown and brick red, ranges n dense to porous and highly vesicular. It oc- s in relatively thin interlocking flows; most of flows are the relatively smooth ropy type oehoe), but a few flows are blocky basalt (aa). ailed factors of the geologic framework that ld directly influence site selection, engineering gn and construction, and operation of reactors e studied chiefly at specific localities on the ion. These factors included the behavior of h materials during drilling, the availability of materials for construction, and the stability of h materials in excavations--under stress and er a range in moisture conditions. The Snake er Plain, including the NRTS, is subject to oc- onal seismic tremors; the oldest recorded k occurred in 1884. (Woodard-USGS)

NCIPLES OF DIMENSIONING THE SUP- RTING SYSTEM FOR THE 'NEW AUSTRI- TUNNELLING METHOD',
. Rabcewicz, and J. Golser.
er Power, Vol 25, No 3, p 88-93, March, 1973. , 28 ref.

criptors: *Tunneling, *Tunnel construction, k mechanics, Safety factors, Stress.
tifiers: Austria.

neling experience during the last ten years in tria has proved the advantage of the 'New trian tunneling method' (NATM) over other hods, particularly in unstable rock. NATM is d on the principle of taking utmost advantage he capacity of the rock to support itself, by fully and deliberately controlling the forces in readjustment process which takes place in the ounding rock after a cavity has been made, adapting the chosen support accordingly. erally two methods of support are carried out. first is a flexible outer arch designed to stabil- the structure accordingly, and consists of a metrically anchored rock arch with surface ection mostly by shotcrete, possibly rein- ed by additional ribs and closed by an invert. behavior of the protective support and the ounding rock during the readjustment process ntrolled by a sophisticated measuring system. second means of support is an inner arch con- ng of concrete, and is generally not carried out re the outer arch has reached equilibrium. Its is to establish or increase the safety factors as ssary. The carrying capacity of the outer arch be decided by the curve characteristic for any n type of rock and primary stress condition. At intersection between the radial stress and the ying capacity curve, equilibrium is reached for respective support resistance. It is a particular ure of the NATAM that the intersections al- s take place at the descending branch of the e. Should a stiffer type of support be chosen he outer arch, the intersection with the carry- apacity curve is bound to rise while the safety r simultaneously decreases. The minimum ying capacity of the inner arch is decided by mallest lining thickness that will allow suita- compaction of the concrete. Should a greater l stress be required, the thickness can be en according to required radial stress and the ired safety factor. Once the carrying capacity e outer arch has been established for certain dard section, the means of strengthening can hosen and computed accordingly. (Sandoski-

INVESTIGATION OF POLYMER-IMPREGNATED CONCRETE PIPE,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
W. C. Cowan, and H. C. Riffle.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 083, $4.50 in paper copy, $2.25 in microfiche. Report REC-ERC-74-14, September 1974. 48 p, 25 fig, 27 tab.

Descriptors: *Concrete pipes, *Mechanical properties, *Concrete testing, *Polymers, Compressive strength, Tensile strength, Shear strength, Laboratory tests, On-site investigations, Precast concrete, Hydrostatic pressure, Concrete technology, Reinforcement, Drains, Sewers, Culverts, Pipes, Absorption, Durability, Reinforced concrete.
Identifiers: *Polymer concretes, Loading tests, Pipe tests, Steel fiber reinforced concrete.

The evaluation of structural and durability properties of polymer-impregnated concrete (PIC) pipe as compared with those of commercially manufactured concrete pipe was presented in three separate studies: (1) 4-inch-diameter concrete draintile, (2) 12- and 24-inch-diameter concrete sewer and culvert pipe, and (3) 36-inch-diameter concrete culvert pipe. Impregnation and polymerization of concrete pipe resulted in significant improvement in strength and durability. Polymer impregnation of concrete draintile increased the three-edge bearing strength from about 70 to 280% above that of the untreated pipe. The three-edge bearing strength of 12- and 24-inch unreinforced concrete sewer and culvert pipe was increased from about 110 to 150% by polymer impregnation. Unreinforced 36-inch-diameter PIC pipe exceeded the ASTM: C 76 requirements for ultimate three-edge bearing load by 50 to 90%. Polymer-impregnated 36-inch-diameter concrete pipe subjected to 5% sulfuric acid showed increases in resistance to sulfuric acid attack of from 2.8 to 7.8 times that of the untreated concrete pipe. PVC PIPE CUTS COLORADO DISTRICT'S FLOW COST,
North Table Mountain Water and Sanitation District, Colo.
B. Byrne.
Water and Sewage Works, Vol 119, No 12, p 51, December, 1972. 2 fig.

Descriptors: *Plastic pipes, *Sewerage, Clay pipes, Colorado, Costs, Joints(Connections), Pipes.
Identifiers: Polyvinyl chloride, North Table Mountain Water and Sanitation District.

Polyvinyl chloride (PVC) pipe has been used to meet tight specifications for the North Table Mountain Water and Sanitation District's sewer system near Denver, Colorado. Replacing vitrified clay pipe specified for all sized below 10 inches, the PVC pipe, with a rubber ring joint seal, meets exacting specifications of 100 gallons per inch diameter per mile per day and should save the district considerable sewage treatment costs. 19,660 feet of 8-inch and 555 feet of 6-inch sizes of the tough, resilient, and high-impact PVC pipe have been installed. Installation of the lightweight, corrosion-resistant pipe was quick and easy especially in soil of a high water level area. (Sandoski-FIRL)

INVESTIGATIONS OF THE APAC WATER SEEPAGE BARRIER,
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
R. K. Frobel.
Master of Science Thesis, 1975. 67 p, 6 tab, 19 fig, 2 append, 20 ref.

Descriptors: *Sealants, *Leakage, *Linings, *Water storage, *Protective coatings, Reservoirs, Canals, Watersheds(Basins), Canal seepage, Seepage, Watertight, Reservoir leakage, Coatings, Impervious membranes, Soil sealants, Waterproofing, Canal linings, Water yield improvement.
Identifiers: APAC method.

Three testing methods were utilized to evaluate the APAC (Asphalt-Plastic-Asphalt-Chip-Coated) method of lining canals, catchments, and reservoirs. The first method tested hydrostatic puncture resistance; the second determined slope stability; and the third tested the overlap seal strength of three available adhesives. In all three tests APAC met the desired standards for providing secure water storage and transportation. (McLachlan-Arizona)

THE HYDRAULIC CHARACTERISTICS OF PLASTIC LAND DRAINAGE PIPE,
Ministry of Agriculture, Fisheries and Food, Cambridge (England). Field Drainage Experimental Unit.
C. W. Dennis.
Proceedings of the Institution of Civil Engineers, Vol 55, Part 2, p 273-284, March, 1973. 11 fig, 2 tab, 17 ref.

Descriptors: *Plastic pipes, *Surface drainage, *Hydraulic design, Clay pipes, Laboratory tests, Construction materials.
Identifiers: United Kingdom.

Land drainage in the United Kingdom is conventionally carried out using short lengths of clayware pipe, water entry to the system being via the gap between individual pipes. Since 1965 plastic drain pipes, of both smooth and corrugated construction, have been gradually introduced, in which the water enters through holes or perforations in the pipe wall. Hydraulic design data for the new product was lacking because of the unusual types of roughness involved. Laboratory tests were carried out and plotted in the conventional form of friction factor against Reynold's number. These graphs give information on flow in the laminar region and on the different types of changes to transitional flow which may occur. More practically, the tests show that the pipes currently available can be divided into three broad catego-

STEEL SELECTED FOR TIGHT EFFLUENT LINE,
Warren and Van Praag, Inc., Decatur, Ill.
A. A. Bensley.
Public Works, Vol 106, No 9, p 96-97, September, 1975. 3 fig.

Descriptors: *Activated sludge, *Construction materials, *Pipelines, *Steel pipes, Sewers, Effluents, Joints(Connections), Installation, Illinois.
Identifiers: Decatur(Ill).

For the connection of a proposed activated sludge treatment stage of the Decatur, Illinois, Sanitary District to aerated lagoons, an effluent pipelines of the best appropriate material had to be chosen. Specifications for the effluent conduit included: a requirement for large size (36, 48, and 72 inches in diameter) conduit to meet limited head loss conditions; internal pressure of one to two pounds per square inch; pipes to be laid in shallow excavations, then covered by earthen embankments to a depth of 3 to 4 feet; and service roadways at given locations. While reinforced concrete pipe was the initial choice for the line, Armco Welded-Seam Helcor Smooth-Flow sewer pipe was found to be a suitable and less costly alternative. The basic material is corrugated steel, zinc coated, and the coils of corrugated steel are helically wound to form round pipe of a consistent diameter. The pipe has an asphalt covered exterior; the interior corrugations are also asphalt covered to a one-eighth inch depth. A combination of bolted connecting bands and rubber O-ring gaskets called Hugger joints, are used to link abutting lengths. Tightness of the joints was field tested, ane air pressure held to within the required limits. Pipe installation operations involved several 20-foot lengths to be laid and bedded, followed by air pressure testing of their individual joints. (Kramer-FIRL)

SEWER INSERTION RENEWAL SAVES TOWN $2.5 MILLION,
R. Doan, Jr., and M. T. Broderick.
Public Works, Vol 106, No 9, p 72-74, September, 1975, 3 fig.

Descriptors: *Sewerage, *Repairing, *Plastic pipes, Sewers, Costs, Conveyance structures, Pipelines, Construction, Maintenance, Joints(Connection), New York.
Identifiers: Sewer pipe insertion, *Polyethylene pipes, Amherst(NY).

Amherst, New York, saved $2.5 million or almost 80% of the cost of conventional sewer renewal by inserting polyethylene pipe into their deteriorating collector. Thirty-six inch (OD) Series 80 'Aldyl' D polyethylene pipe was pulled through 48-in (ID) tile block collector. Application of the Manning flow formula proved that the smooth interior of the 32-in polyethylene pipe would offer little resistance to the flow. This reduced resistance to flow in the inserted pipe maintained the original flow capacity. Specifications for the insertion process included: descriptions for unloading and storing 90, 39-ft lengths of polyethylene pipe: construction of three inch shafts and two entry shafts; butt fusion of the polyethylene pipe; clearing the old pipe prior to insertion; the actual steps of the insertion; details of mechanical connections; directions for tapping the polyethylene pipe at the line's three manholes; provisions for assurance of flow in the parallel 8-in sanitary line; procedures and materials for grouting; and procedures and materials for laying concrete protection over mechanical connections. Each of these specifications is discussed. The process renewed 3400 feet of the sanitary collector, possibly the biggest sewer insertion renewal project ever attempted by a municipality. The success of the project prompted Amherst to commit municipal labor to massive insertion renewal of sewers throughout the town. (Orr-FIRL)
W76-01461

LONGEVITY OF SEWER GROUT UNDER SEVERE CONDITIONS,
Hollywood Utilities Dept., Fla.
T. P. Calhoun.
Public Works, Vol 106, No 10, p 80, October, 1975.

Descriptors: *Construction materials, *Analytical techniques, *Sewer systems, Joints(Connections), Pipelines, *Grouting.
Identifiers: Acrylamide.

The performance of an acrylamide-based grout for the repair of sewer joints, which has been used since 1960, was evaluated in Hollywood, Florida. Because the area is involved in large amounts of sewer maintenance and rehabilitation, it was felt important that a grouted joint that had been exposed to severe conditions for several years be examined for deterioration. An 8-inch transverse main that had been grouted six years previous to examination was chosen. The joint was located in a section where sandy soil is periodically subjected to salt water intrusion, fresh water flooding, and prolonged dry spells. The line carries both domestic sewage and industrial waste. Visual inspection of the gel showed no signs of physical deterioration. While the soil was above the water table, no signs of grout desiccation were found. The gel ring was cut and the inside showed a solid matrix of sand and gel all the way through the pipe. Samples bf gel were sent to be inspected in a laboratory that manufacture acrylamide-based grout. No indications of shrinkage or chemical degradation could be measured. Thus, the grouted joints appear to have a very long-term life expectancy and appropriations for further grouting have been approved. (Kramer-FIRL)

AN EXPERIMENT IN THE MIXED CULTURE OF CHANNEL CATFISH AND LARGEMOUTH BASS,
Illinois State Natural History Survey, Urbana.
D. H. Buck, R. J. Baur, and C. R. Rose.
Prog Fish-Cult. Vol 35, No 1, p 19-21. 1973. Illus.

Descriptors: *Bass, *Channel Catfish, Fish Management.

Consideration is given to the practicability for the combined culture of largemouth bass (Micropterus salmoides) and channel catfish (Ictalurus punctatus) in subadult sizes. Bass trained to accept pelleted food were stocked both alone and in combination with channel catfish in outdoor, unshaded, 10-foot-diameter plastic pools having soil substrates. Over a 70-day feeding period the catfish made the better gains, but the 2 species appeared to be completely compatible with neither limiting the production of the other.--Copyright (c) 1973, Biological Abstracts, Inc.

Skidaway Inst. of Oceanography, Savannah, G
L. V. Sick, D. White, and G. Baptist.
Prog Fish-Cult Vol 35, No 1, p 22-26. 1973 Illus

Descriptors: *Shrimp, Fish diets, Fish physiol

Rates of pelleted formula diet ingestion (mg f ingested/g animal dry weight/hr) were determi for different size juvenile shrimp (Pena setiferus) (2-4 g, 5-7 g, and 15-20 g) fed at 10 and 30% of their total biomass, for feeding per of 6, 12 and 24 hr and under light intensities of 250 and 1100 ft-c. These interactions, tested u two 3 x 3 x 3 factorially designed random complete block experiments, revealed that highest average rate of ingestion (5.9) occu among animals fed 10% of their total bion under 1100 ft-c of light and exposed to the s food for only 6 hr. Comparing animal size, ligh tensity, and period of exposure to the same f revealed that rates of ingestion increased with creases in light intensity, decreased with an size (on a unit weight basis), and decreased with increase in period of exposure to the same food a 2nd experiment comparing animal size, ligh tensity, and amount of food, rates of food gestion for differences in animal size and ligh tensity were the same as in experiment 1. Inges rates did not change with increases in amount food fed above 10% of total biomass.--Copyr 1973, Biological Abstracts, Inc.

ultifilis.

hanges in leukocyte counts in mirror carp in-
cted with Ichthyophthirius multifiliis were
corded during the disease. Leukocytes were
assified according to their appearance and stage
development. The overall white blood cell count
infected carp remained within the range found
normal carp under similar conditions. The 1st
cognizable event in leukocyte dynamics was a
arp but temporary drop in lymphocytes with a
ncurrent rise in neutrophil percentages early in
e infection. A similar trend also appeared
wards the end of the infection. A significant shift
wards younger cell populations was evident
nong the neutrophils. Blast cells with morpholog-
al characteristics of neutrophils appear in the cir-
lation. The percentage of these cells and of
her blast cells rose progressively during the in-
ction. The number of cells termed fine reticular
lls, also rose during infection. White blood cell
anges in the Nirror carp infected with I. mul-
iliis were similar to changes observed for other
seases and also in response to certain stress con-
tions.--Copyright 1974, Biological Abstracts,

W76-01197 5C

The Elimination of Phosphates and Nitrates of Waste Water by Algae Cultures: I (/n Flemish),
W76-01312 5D

ALGAL CONTROL

An Evaluation of Artificial Destratification for Control of Algal Blooms,
W76-01147 5C

ALGAL SPECIES DIVERSITY

The Algal Microflora of a String Mire in Relation to the Chemical Composition of Water,
W76-01200 5C

ALISO CREEK (CALIF)

Flood Plain Information: Aliso Creek, Orange County, California.
W76-01362 4A

ALKALINITY

Total Alkalinity and Hardness of Surface Waters in Alabama and Mississippi,
W76-01144 2K

ALLIGATORWEED

Biological Control of Alligator Weed,
W76-01495 4A

ALPHA-PARTICLE SPECTROMETRY

Postdepositional Injections of Uranium-Rich Solutions into East Pacific Rise Sediments,
W76-01098 8E

ALTERNATIVE PLANNING

Water Reuse: A Flexible and Efficient Management Alternative for Municipal Water Supply,
W76-01330 5D

Modeling of Future Expenditures for Planning and Economic Evaluation of Alternatives,
W76-01336 6A

The Economic Efficiency of Inter-Basin Agricultural Water Transfer in Utah: A Mathematical Programming Approach,
W76-01341 4A

ALUMINUM

Removal of Phosphates and Metals from Sewage Sludges,
W76-01100 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Bauxite Refining Subcategary oi the Aluminum segment of the Non-Ferrous Metals Manufacturing Point Source Category,
W76-01201 5G

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Secondary Aluminum Smelting Subcategory of the Aluminum Segment of the Nonferrous Metals Manufacturing Point Source Category,
W76-01231 5G

AMMONIA

Uptake and Translocation of Ammonia by Freshwater Hydrophytes,
W76-01161 2I

An Integrated Power Process Model of Water Use and Wastewater Treatment in Ammonia Production,
W76-01234 5D

ANACOSTIA RIVER

Mathematical Model Studies of Water Quality in the Potomac Estuary,
W76-01497 5B

ANAEROBIC CONDITIONS

Evaluat.on of Anaerobic Lagoon Treating Swine Wastes,
W76-01032 5D

ANAEROBIC DIGESTION

The Anaerobic Digestion of Waste From an Intensive Pig Unit,
W76-01379 5D

ANALYTICAL TECHNIQUES

Metal Analysis by Model 630-C Hitachi Liquid Chromatograph (630-C-Gata Hitachi Ekitai Kuromatographu Ni Yoru Kinzoku Bunseki),
W76-01060 5A

The Geochemistry of Sediments From the Northern Reykjanes Ridge and the Iceland - Faroes Ridge,
W76-01097 2K

Postdepositional Injections of Uranium-Rich Solutions into East Pacific Rise Sediments,
W76-01098 8E

Anodic Stripping Voltammetry with the Florence Mercury Film Electrode Determination of Copper, Lead and Cadmium in Sea Water,
W76-01105 5A

The Rapid Quantitation of the Filamentous Blue-Green Alga Plectonema Boryanum by the Luciferase Assay for ATP,
W76-01158 5C

Measurement of Zooplankton Biomass by Carbon Analysis for Application in Sound Scattering Models,
W76-01163 5A

Bacterial Flora of Saline Aquifers,
W76-01254 5A

Calculations of Differential Kinematic Properties from Lagrangian Observations in the Western Caribbean Sea,
W76-01257 2L

Limited Arsenic Dispersion in Sea Water, Sediments, and Biota Near a Continuous Source,
W76-01262 5C

A Method for the Determination of Toxicity of Pollutants in Water and Effluent to Bacteria (Eine Methode Zur Bestimmung der Bakterientoxizitaet von Schadstoffen in Wasser und Abwasser),
W76-01292 5A

Experience with the Determination of the Biochemical Oxygen Demand With Special Consideration of the Modified 'Viehl Dilution Method, (Erfahrungen Mit Der Bestimmung Des Biochemischen Sauerstoffebedarfs Unter Besonderer Beruecksightigung Der Modifizierten Viehl 'Schen Verduennungsmethode),
W76-01442 5D

The Measurement of MLSS Using Integrated Spherical Type Turbidimeter. (In Japanese)
W76-01445 5A

Longevity of Sewer Grout Under Severe Conditions,
W76-01462 8G

ANHYDROUS AMMONIA

Anhydrous Ammonia Application in Irrigation Water VS Mechanical and its Effect on Corn Yields,
W76-01072 3F

ANIMAL WASTES

The Problem of Farm Animal Waste Disposal,
W76-01037 5E

AQUATIC ALGAE

Communities of the Periphyton Algae of Channel Lakes of Byszewo,
W76-01168 5C

AQUATIC INSECTS

Biological Control of Alligator Weed,
W76-01495 4A

AQUATIC PLANTS

Use of Waterhyacinths to Remove Nitrogen and Phosphorus from Eutrophic Waters,
W76-01148 5C

Uptake and Translocation of Ammonia by Freshwater Hydrophytes,
W76-01161 2I

Experimentally Increased Fish Stock in the Pond Type Lake Warniak. XII. Numbers and Biomass of the Fauna Associated with Macrophytes,
W76-01174 2H

AQUATIC WEED CONTROL

Biological Control of Alligator Weed,
W76-01495 4A

AQUATIC WEEDS

Change in Planktonic Complexes in the Eutrophic Lake Baltym Due to Overgrowth by Weed,
W76-01172 5C

AQUEOUS SOLUTIONS

A Reexamination of the Equilibrium Conditions in the Theory of Water Drop Nucleation,
W76-01478 2B

Freezing Nucleation in Aqueous Electrolytes,
W76-01479 2B

AQUICULTURE

On the Mariculture of the Florida Seaweed, Eucheuma Isiforme,
W76-01151 6B

Geography and Lake Morphometry of the Aquaculture Study Areain the Erickson-Elphinstone District of Southwestern Manitoba,
W76-01166 2H

AQUIFER CHARACTERISTICS

Procedures for the Optimum Use of Geophysical Methods in Groundwater Development Programs,

PRIMARY PRODUCTIVITY
Water Quality and Phytoplankton Productivity of Summersville Reservoir,
W76-01143 5C

PROBABILITY
An Evaluation of Artificial Destratification for Control of Algal Blooms,
W76-01147 5C

The Weibull Probability Assignment Technique: An Application to Benefit-Cost Analysis,
W76-01331 6A

PROCTORS CREEK (VA)
Flood Plain Information: Proctors Creek, Chesterfield County, Virginia.
W76-01372 4A

PRODUCTIVITY
Total Alkalinity and Hardness of Surface Waters in Alabama and Mississippi,
W76-01144 2K

Species Composition, Standing Stock, and Net Primary Production of a Salt Marsh Community in Mississippi,
W76-01164 2L

Some Carpathian Reservoirs and Their Production Relations,
W76-01175 5C

PROJECT BENEFITS
Benefit-cost Analysis and Multiple-Purpose Reservoirs: A Reassessment of the Conservation Authorities' Branch Deer Creek Project, Ontario,
W76-01349 6B

PROJECT PLANNING
Approaches to Multiobjective Planning in Water Resource Projects,
W76-01335 6A

Benefit-cost Analysis and Multiple-Purpose Reservoirs: A Reassessment of the Conservation Authorities' Branch Deer Creek Project, Ontario,
W76-01349 6B

Tradeoffs Between Irrigation Systems with Different Reliabilities of Supply,
W76-01424 3F

PROJECTS
Computer Assisted Procedures in Water Project Evaluation,
W76-01007 6A

Engineering the Bear Swamp Project,
W76-01010 6A

Water Resources of Volcanic Islands, a Pilot Project in the Canaries,
W76-01258 2A

Modeling of Future Expenditures for Planning and Economic Evaluation of Alternatives,
W76-01336 6A

A Systems Analysis of a Continuous Water Quality Monitoring Project,
W76-01342 5A

PROTECTION
Methods of Avalanche Control in Washington Mountain Highways--Summary Report,
W76-01492 2C

PROTECTIVE COATINGS
Investigations of the APAC Water Seepage Barrier,
W76-01115 8G

PROTOTYPE TESTS
Development of a High Seas Oil Recovery System, Phase II, Appendix II. Materials and Component Tests,
W76-01226 5G

Development of a High Seas Oil Recovery System, Phase II, Appendix III. System Tests,
W76-01227 5G

LIBRARY U. OF I. URBANA-CHAMPAIGN

PSEUDOMONAS
Role of Bacteria in Bioaccumulation of Mercury in the Oyster Crassostrea Virginica,
W76-01102 5B

PSYCHROMETER CONSTANT
Gamma--The Psychrometer Non-Constant,
W76-01473 2D

PUBLIC ACCESS
Hawaiian Beach Access: A Customary Right,
W76-01401 6E

PUBLIC HEALTH
Water Supplies for Low-Income Communities in Developing Countries,
W76-01004 5G

Control of the Pollution of Surface Water Bodies (Bestrijding Verontreininging oppervlaktewater),
W76-01452 5D

PUBLIC INTEREST
Water Resources Decision Making on the Basis of the Public Interest,
W76-01015 6A

PUBLIC INVOLVEMENT
Water Resources Decision Making on the Basis of the Public Interest,
W76-01015 6A

PUBLIC PARTICIPATION
Structuring Communications Programs for Public Participation in Water Resources Planning,
W76-01014 6A

Citizen Influence in Water Policy Decisions: Context, Constraints, and Alternatives,
W76-01332 6B

The Role of the Public in Decision-making,
W76-01357 6B

PUERTO RICO
Floods in Eastern Lajas Valley and the Lower Rio Loco Basin, Southwestern Puerto Rico,
W76-01182 2E

Floods in the Carolina-Rio Grande Area, Northeastern Puerto Rico,
W76-01185 2E

PULP WASTES
Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Unbleached Kraft and Semichemical Pulp Segment of the Pulp, Paper, and Paperboard Mills Point Source Category,
W76-01212 5G

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Building, Construction, and Paper Segment of the Asbestos Manufacturing Point Source Category,
W76-01217 5G

PUMPED STORAGE
Engineering the Bear Swamp Project,
W76-01010 6A

PUMPS
Submersible Lift Stations Cut Pump Maintenance Costs.
W76-01460 8C

QUANTITATIVE TECHNIQUES
Quantitative Techniques for Evaluating the Environmental Impact of Transportation Systems,
W76-01009 4C

RADAR
Raindrop-Size Distributions in the Melbourne Area,
W76-01417 2B

RADIAL WALL JET
Characteristics of a Circular Jump in a Radial Wall Jet,
W76-01267 8B

RADIATION
A Note on the Effect of Chemical Treatments in the Mineralogical Studies of Sediments,
W76-01109 5A

Snowpack Dynamics in Relation to Inventory-Prediction Variables in Arizona Mixed-Conifer,
W76-01123 2A

Radiation Treatment Method and Apparatus for Decontamination of Polluted Fluid,
W76-01136 5D

The Relation Between Ablation and Global Radiation over Peyto Glacier, Alberta,
W76-01249 2C

RADIOACTIVE WASTES
Department of Environmental Protection v Jersey Central Power and Light Co. (Damages for Fish Kill from Discharge of Cold Water inot Normally Warmed Water),
W76-01394 6E

RADIOISOTOPES
Postdepositional Injections of Uranium-Rich Solutions into East Pacific Rise Sediments,
W76-01098 8E

Application of Isotope Techniques to Glacier Studies,
W76-01252 2C

Uptake and Migration of Tracers in Lake Sediments,
W76-01475 2H

RADIOMETRIC MEASUREMENTS
Measurements of Wind-Driven Flow Profiles in the Top Millimeter of Water,
W76-01260 2H

RAINDROPS
Raindrop-Size Distributions in the Melbourne Area,
W76-01417 2B

RAINFALL-RUNOFF RELATIONSHIPS
Phosphorus in Surface Runoff from a Deciduous Forest,
W76-01145 5B

Hydrologic Data for Little Elm Creek, Trinity River Basin, Texas, 1973,
W76-01181 2E

The Importance of Accurate Curve Numbers in the Estimation of Storm Runoff,
W76-01305 2A

An Evaluation of Three Rainfall-Runoff Models,
W76-01419 2A

Problems in the Programmed Optimisation of a Hydrological Catchment Model,
W76-01420 2A

Simulation of the Rainfall-Runoff Process Using a Hysteretic Infiltration-Redistribution Model,
W76-01421 2A

Comparison of some Calculation Methods for Rainwater Runoff (Vergleich einiger Berechnungsmethoden von Regenwasser-Kanalisationen),
W76-01426 2A

RANGES
Nutrient and Sediment Discharge from Agricultural Watersheds in Oklahoma,
W76-01116 2A

RECOVERY EFFICIENCY
Underground Storage of Treated Water: A Field Test,
W76-01253 2F

RECREATION
User Response to Water Quality and Water-based Recreation in the Qu'Appelle Valley, Saskatchewan,

LIBRARY U. OF I. URBANA-CHAMPAIGN

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

1 NATURE OF WATER

2 WATER CYCLE

3 WATER SUPPLY AUGMENTATION AND CONSERVATION

4 WATER QUANTITY MANAGEMENT AND CONTROL

5 WATER QUALITY MANAGEMENT AND PROTECTION

6 WATER RESOURCES PLANNING

CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service, U.S. Department of Commerce, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates are: SWRA Journal only, $75 ($95 foreign); Journal and Annual Indexes, $100 ($125 foreign); Indexes only, $50 ($65 foreign).

Some documents abstracted in this journal can be purchased from NTIS at prices shown in the entry; prices subject to change. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

LIBRARY COPY - DO NOT REMOVE

VOLUME 9, NUMBER 4
FEBRUARY 15, 1976

W76-01501 -- W76-02000

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

TORM RUNOFF IN THE VICINITY OF OAK IDGE, TENNESSEE,
ak Ridge National Lab., Tenn.
D. Sheppard.
vailable from the National Technical Informa-on Service, Springfield, Va 22161 as ORNL M4662, $4.00 in paper copy, $2.25 in microfiche. eport No. ORNL-TM-4662, October 1974. 24 p, 0 fig, 1 tab, 22 ref. ERDA W-7405-eng-26.

Descriptors: *Rainfall-runoff relationships, Storm runoff, Hydrology, *Streamflow, *Flow uration, *Frequency analysis, Rainfall, Runoff, Meteorological data, Probable maximum recipitation, *Tennessee.
dentifiers: *Oak Ridge(Tenn), *Rainfall frequen-y, Annual series, Exceedance series.

Rainfall in the vicinity of Oak Ridge, Tennessee, rom 1948 through 1971 was examined for periodic effects. Many hydrologic studies in the area by various agencies were summarized. Both annual maximum and exceedance series were used to analyze rainfall of various durations. It was shown hat a storm containing a 100-year long duration event will not necessarily contain a 100-year short duration event. Flow duration analysis using mean daily flows were presented for gaged catchments ranging in size from 0.38 to 82.5 sq mi. It was shown that the average response of streams in the area to storm conditions, as determined by daily flow duration curves, is linear with drainage area. (Terstriep-ISWS)

ON TH VARIABILITY OF 'DYNAMIC SEEDABILITY' AS A FUNCTION OF TIME AND LOCATION OVER SOUTH FLORIDA. PART II. TEMPORAL VARIABILITY,
National Hurricane and Experimental Meteorology Lab., Coral Gables, Fla.
W. R. Cotton, and A. Boulanger.
Journal of Applied Meteorology, Vol 14, No 7, p 1376-1382, October 1975. 7 fig, 4 ref.

Descriptors: *Weather modification, *Cloud seeding, *Florida, Atmosphere, Sounding, Temperature, Humidity, Rainfall, Precipitation(Atmospheric), Artificial precipitation, Model studies, Mathematical models, Cloud physics, Meteorology.

Using the one-dimensional cumulus model developed by Cotton, predictions of the effects of seeding cumulus clouds were performed during the month of July 1973 as part of the Experimental Meteorology Laboratory's Florida Area Cumulus Experiment 1973 experiment. In Part I seedability predictions with the Miami 1200 GMT soundings were compared with soundings taken over the center of the experimental area (central site) at 1400 GMT. It was found that substantial differences between the two predictions occurred on a number of days in spite of the fact that the soundings were separated in time by only 2 h and in space by only 110 km. Here the seedability predictions with the MIA 1200 GMT soundings and the CS 1800 GMT soundings were compared. The CS 1800 GMT soundings were assumed to be representative of conditions over the experimental area during the period of operation of the experiment. It was found that the predictions with the MIA 1200 GMT soundings were, on the average, more representative of conditions over the center of the experimental area during the period of operation of the experiment than were the predictions with the CS 1400 GMT soundings. The results indicated that the choice of a sounding site and sounding time to be used for prediction of seeding effects over an experimental area must be carefully considered in the design of the experiment. THE CLIMATE OF CHIHUAHUA, MEXICO,
Texas Univ. at El Paso. Geological Sciences.
R. H. Schmidt, Jr.
The University of Arizona Institute of Atmospheric Physics, Technical Reports on the Meteorology and Climatology of Arid Regions, No 23, 1975, 50 p, 29 fig, 18 ref.

Descriptors: *Climatology, *Mexico, *Semiarid climates, *Precipitation(Atmospheric), Climates, Climatic data, Meteorology, Temperature, Topography, Weather, Weather data, Arid climates, Humid climates, Rainfall, Meteorological data, Altitude.
Identifiers: Chihuahua(Mexico).

The climatological data used in this study, which is derived from seven agencies in Chihuahua which operate a combined total of about 130 meteorological stations in the state, represent a relatively short record (10-15 years). The mean annual precipitation for the state is 409 mm, the average temperature is 16 C with record extremes of minus 30 C and 48 C. Most of the state's precipitation falls in the form of rain during brief summer thundershowers. A comparison between the mean and median indicates that annual temperatures are near stabilization and annual precipitation totals are not. The state's two major climatic groups are closely associated with the geomorphic units. The arid and semiarid zone of the state generally coincides with the Basin and Range, and the humid mesothermal climates are found in the Sierra Madre Occidental. (Robinett-Arizona)

SURFACE ALBEDO AND DESERTIFICATION,
Agricultural Research Service, Water Conservation Lab. Phoenix, Ariz.
R. D. Jackson, and S. B. Idso.
Science, Vol 189, p 1012-1013, September 19, 1975, 1 fig, 10 ref.

Descriptors: *Albedo, *Deserts, *Vegetation effects, *Soil surfaces, *Rainfall, Arid lands, Grazing, Vegetation, Soil-water-plant relationships, Soil physical properties, Temperature, Soil temperature.
Identifiers: *Surface albedo, *Desertification, Overgrazing.

Evidence is offered and a theory is presented for disclaiming the hypothesis by Otterman which states that when high-albedo soils are denuded (vegetation removed by overgrazing), the resultant increase in surface albedo causes lower surface temperatures, which in turn reduce the heat input to the lower atmosphere, decrease its temperature lapse rate, and hence somewhat reduce convective activity leading to rainfall. From results of experimentation, the authors predict that the denuded surface would be warmer than the vegetated one. It is believed that Otterman's assumed value of 0.9 for emissivity for both the bare and vegetated areas could have introduced temperature errors as great as 8 C. (Robinett-Arizona)

LONG-TERM STREAMFLOW RECORDS RECONSTRUCTED FROM TREE RINGS,
Arizona Univ., Tucson. Lab. of Tree-Ring Research.
C. W. Stockton.
Paper of the Laboratory of Tree-Ring Research No. 5, University of Arizona Press, Tucson, 1975. 111 p.

Descriptors: *Dendrochronology, *Streamflow, *Colorado River Basin, *Time series analysis, *Climatology, Rainfall, History, Trees, Average flow, Hydrology, Runoff, Streams, Streamflow forecasting, Colorado River, River basins, Hydrologic data, Droughts, Statistical methods, Frequency analysis, Precipitation(Atmospheric).
Identifiers: Tree rings, Bright Angel Creek Basin(Ariz), Hydrologic records, San Francisco River Basin(New Mexico), Lees Ferry(Ariz), Wet periods, Dendrohydrology, Streamflow record.

A study to investigate the use of tree-ring series for augmenting hydrologic records is described. Two watersheds, the Bright Angel Creek Basin in north-central Arizona and the San Francisco River Basin in west-central New Mexico, are studied and the knowledge gained then applied to the Upper Colorado River Basin. The subject of the investigation is the variablity in the response of the runoff to climatic parameters, and the corresponding response of the tree-ring series. Results indicate that the longterm mean runoff at Lees Ferry (a point just below the northern Arizona border on

the Colorado River) is about 13 million acre-ft. per year, the variance (in million acre-ft. squared) is 13.95, very serious droughts occurred during the periods 1565-1600 and 1870-1890, and the two extended periods of maximum runoff that occurred during the past 400 years were immediately preceded by a period of extended low runoff. (Robinett-Arizona)
W76-01708

HEAVY FALL AND WINTER RAIN IN THE CAROLINA MOUNTAINS,
National Weather Service, Garden City, N.Y. Eastern Region.
D. B. Gilhousen.
Available from the National Technical Information Service, Springfield, Va 22161, as COM-74 11761, $3.50 in paper copy, $2.25 in microfiche. NOAA Technical Memorandum NWS ER-57, October 1974. 6 p, 3 fig, 1 ref.

Descriptors: *Excessive precipitation, *Rainfall, *Mountains, *North Carolina, *South Carolina, Floods, Winter, Autumn, Precipitable water, Air circulation, Atmosphere, Precipitation(Atmospheric), Weather patterns, Weather, Runoff forecasting, Meteorology.
Identifiers: *Carolina mountains.

There were eight known days in the period Ocotober 1, 1972 to March 31, 1973 in which more than two inches of rain occurred at any North or South Carolina Mountain Station. These cases were studied to see if common patterns could be identified to assist in recognizing the threat of heavy rain. The study focused on the 850, 500, 300 mb. analyses, precipitable water and stability charts available just prior to the onset of heavy rain. Also considered were the latest trajectory model forecasts that were available prior to the occurrence of heavy rain. Common characteristics were found in the synoptic scale patterns and trajectory model forecasts available prior to the onset of heavy rain. In the future, if these features are identified in the fall and winter months, the threat of locally heavy rain is established. The extent of over-warning, however, is not known since it was not determined how often these features occurred and heavy rain did not fall. (Sims-ISWS)

FORMATION OF CLOUD AND ICE NUCLEI BY THE COMBUSTION OF CRUDE OIL,
National Oceanic and Atmospheric Administration, Boulder, Colo. Environmental Research Lab.
C. C. Van Valin, R. F. Pueschel, and F. P. Parungo.
Journal of Applied Meteorology, Vol 14, No 6, p 1200-1203, September 1975. 2 fig, 1 tab, 11 ref.

Descriptors: *Nucleation, Oil wells, *Burning, Smoke, Oil, Chemistry, Aircraft, Sampling, Surveys, On-site investigations, Pollutants, Air pollution, Meteorology, *Pollutant identification, Cloud physics, Ice, *Wyoming.
Identifiers: *Oil well fires, *Glenrock(Wyo), Aitken nuclei concentrations, Ice nuclei concentrations, Plumes.

Aitken nuclei and ice nuclei concentrations in the smoke plume from an oil well fire at Glenrock, Wyoming, on Dec. 14, 1973 were found to be elevated by at least an order of magnitude as compared with the surrounding atmosphere. The composition of most particles in the plume was suggestive of the clay minerals; these could account for the increased ice nuclei concentrations. (Sims-ISWS)
W76-01857

A COMPARISON OF CANADIAN AND UNITED STATES STANDARD METHODS OF MEASURING PRECIPITATION,
Windsor Univ. (Ontario). Dept. of Geography.
M. Sanderson.
Journal of Applied Meteorology, Vol 14, No 6, p 1197-1199, September 1975. 2 fig, 2 tab, 6 ref.

Descriptors: *Precipitation(Atmospheric), *Measurement, *Rain gages, *Canada, *United States, Snowfall, Rainfall, Gages, Data collections, Methodology, Meteorology.
Identifiers: Comparison of methods.

Methods of measuring precipitation vary from country to country. Consequently, the comparability of precipitation data along international borders is questionable. Five years of precipitation data at Windsor, Ontario, using the standard Canadian and United States methods of measuring precipitation were compared. Monthly rain amounts were very similar, but substantial differences existed in snow measurement. The Canadian method appeared to overestimate precipitation from snowfall. (Sims-ISWS)

RADAR REFLECTIVITY FACTOR CALCULATIONS IN NUMERICAL CLOUD MODELS USING BULK PARAMETERIZATION OF PRECIPITATION,
South Dakota School of Mines and Technology, Rapid City. Inst. of Atmospheric Sciences.
P. L. Smith, Jr., C. G. Myers, and H. D. Orville.
Journal of Applied Meteorology, Vol 14, No 6, p 1156-1165, September 1975. 8 fig, 18 ref. NSF GA-36910X, Bureau of Reclamation 14-06-D-6976.

Descriptors: *Radar, *Hail, *Model studies, Mathematical models, Computer models, Precipitation(Atmospheric), Remote sensing, Rain, Raindrops, Size, Storms, Thunderstorms, Meteorology.
Identifiers: *Radar reflectivity factor, Numerical cloud models, Hail size distribution.

Various methods for calculating radar reflectivity factors in numerical cloud models that use bulk methods to characterize the precipitation processes were described and compared. Equations sensitive to changes in the parameters of the particle size distributions were favored because they allow simulation of phenomena causing such changes. Marshall-Palmer-type functions were established to represent hailstone size distributions because the previously available distributions lead to implausibly large reflectivity factors. Simplified equations were developed for calculating reflectivity factors for both dry and wet hail. Some examples were given of the use of the various equations in numerical cloud models. (Sims-ISWS)

A FRAZIL ICE CONCENTRATION MEASURING SYSTEM USING A LASER DOPPLER VELOCIMETER,
Bendix Corp., Davenport, Iowa. Instruments and Life Support Div.
C. C. Schmidt, and J. R. Glover.
Journal of Hydraulic Research, Vol 13, No 3, p 299-314, 1975. 5 fig, 6 ref. NSF GK35918X1.

Descriptors: *Frazil ice, *Instrumentation, *Laboratory equipment, *Electronics, Ice, Velocity, Measurement, Temperature, Data collections.
Identifiers: *Laser Doppler Velocimeter, Ice particles, Concentration, Icing, Optical scattering.

A laboratory instrument to measure frazil ice was developed by designing special electronics to process the signal produced by a commercial Laser Doppler Velocimeter. The system performance was evaluated by comparing experimental measurements with theoretical results. The upper concentration that could be measured was not determined. The system limitations were discussed. The instrument was calibrated to provide measurements of flow velocity and frazil ice concentration without flow disturbance and icing problems. (Adams-ISWS)

2D. Evaporation and Transpiration

SOYBEAN AND CORN ROOTING IN SOUTHWESTERN MINNESOTA: II. ROOT DISTRIBUTIONS AND RELATED WATER INFLOW,
Agricultural Research Service, Pendleton, Oreg.
R. R. Allmaras, W. W. Nelson, and W. B. Voorhees.
Soil Science Society of America Proceedings, Vol 39, No 4, p 771-777, July-August 1975. 3 fig, 8 tab, 30 ref.

Descriptors: *Root systems, *Corn(Field), *Soybeans, *Absorption, *Inflow, *Minnesota, Soil water movement, On-site investigations, Soil properties, Hydraulic conductivity, Plant growth, Moisture stress, Plant populations, Root development, Harvesting, Crop production, Soil-water-plant relationships, Depth, Mathematical models, Regression analysis, Resistance.
Identifiers: *Root length density, *Specific water inflow, Determinate isoline, Indeterminate isoline.

Root length density (RLD) of corn and two isolines (determinate and indeterminate) of Harosoy soybean in a Nicollet soil were measured from July 1 to August 15, 1971. Both soybean isolines had about 0.2 cm/cu cm RLD in the Ap layer with values less than 0.1 below the Ap layer. The RLD distribution persisted with depth as

system expanded vertically. Corn RLD were
t 0.3 initially in the Ap layer, and as the root
em expanded vertically, maximum RLD of
t 0.3 was produced even to the 100-cm depth
ugust 9. Vertical extension rates of corn after
1 were 1.3 cm/day as compared with 1.7 for
eans, but maximum rooting depths on August
ere 145 and 120 cm, respectively. Modal
ific water inflows were 0.03 cu cm/cm root per
Maximal values for soybeans were 0.2; max-
values for corn were about 0.05. Maximum
ean rooting depths coincided with maximum
h of water uptake sink, but corn rooting
hs ranged 15 to 30 cm deeper than the water
ke sink. Specific water inflow generally in-
sed as soil hydraulic conductivity increased
RLD decreased, which agrees with models for
dy-state water flow into single roots. At low
, specific water inflows were either constant
ncreased as hydraulic conductivity decreased.

NAL EVAPORATION DETERMINED BY ERMAL MODELING,
logical Survey, Bay Saint Louis, Miss.
E. Jobson.
rint from Proceedings of the Symposium on deling Techniques held at San Francisco Calif, tember 3-5, 1975: American Society of Civil gineers, p 729-743, 1975. 5 fig, 17 ref, 2 append.

scriptors: *Model studies, *Evaporation, rface waters, *Water temperatures, Canals, ite element analysis, Analytical techniques, uations, Winds, Channel morphology, Heat nsfer, Correlation analysis, Forecasting, alifornia.
ntifiers: *San Diego Aqueduct(Calif).

e thermal balance of the 26-kilometer San Diego ueduct in southern California was studied to ermine the manner in which the surface change varies with meteorologic factors. teorologic and hydraulic variables, as well as water temperature at each end of the canal, re continuously monitored. Data were analyzed the Eulerian framework by use of a one-dimen-nal, finite-difference model. Field measure-nts indicated the water temperature was well xed in the cross section. The model predicts the mperature at the downstream end of the canal as unction of time. Analyzing 12 days of data, the ass-transfer coefficient in the Dalton-type aporation equation was varied by trial and error til the predicted and measured downstream tem-ratures most nearly agreed in the least-squares nse. The root-mean-square error of the pre-cted temperature was quite sensitive to the ass-transfer coefficient. Another finite-dif-rence model was constructed which allows the ta to be analyzed in the Lagrangian framework. his model allows the construction of a graph of e Dalton wind function versus windspeed. ithin the range of 0.5 to 4 meters per second the ind function appeared to vary linearly with wind-eed. The mass-transfer coefficient developed r lakes provides a reasonable approximation of e wind function provided the short effective tch of a stream is properly accounted for. Woodard-USGS)

VAPOTRANSPIRATION OF DRYLAND BAR-EY WITH DIFFERENT PLANT SPACING PAT-ERNS,
alifornia Univ., Riverside.
. E. Luebs, A. E. Laag, and P. A. Nash.
gronomy Journal, Vol 67, No 3, p 339-342, May-une, 1975. 1 fig, 3 tab, 6 ref.

escriptors: *Evapotranspiration, *Crop produc-on, *Crop response, *Planting management, Barley, Drought resistance, Growth stages, Plant rowth, Water requirements, Water utilization, ysimeters, Soil moisture, Transpiration, Plant physiology, Soil-water-plant relationships, Moisture stress, Canopy.
Identifiers: *Plant spacing patterns, Hordeum vulgare L., Leaf area index, Row spacing.

Results are reported of an experiment which was conducted during the 1969-70 growing season near Riverside, California, to study the effect of plant spacing patterns of dryland barley (Hordeum vulgare L.) on leaf area index, crop canopy, evapotranspiration, and yield. The minimum unit area of equal plant population density for all spacing patterns was 240 sq cm. Crop canopy and leaf area index were lowest for the grid spacing pattern (8.3-cm row spacing with seeds spaced 7.4 cm in the row) largely because of less tillering. The paired-row pattern (8.1 cm spacing between rows in a pair and 24.3 cm between pairs with seeds spaced 3.7 cm in the row) had highest leaf area index but intermediate crop canopy during the vegetative phase with adequate water. Slightly greater evapotranspiration values were found during the first two-thirds of the growing season for the standard row pattern (16.3-cm row spacing with plants spaced 3.7 cm in the row) which resulted in greater water stress and lower evapotranspiration values later in the season, but grain yield was not affected. (Robinett-Arizona)

ESTIMATING EVAPOTRANSPIRATION UNDER NONHOMOGENEOUS FIELD CONDITIONS,
Agricultural Research Service, University Park, Pa. Northeast Watershed Research Center.
L. H. Parmele, and E. L. Jacoby, Jr.
NE-51, April, 1975. 61 p, 8 fig, 4 tab, 32 ref, 4 append.

Descriptors: *Evapotranspiration, *Topography, *Micrometeorology, *Energy budget, Ohio, Small watersheds, Slopes, Microclimatology, Lysimeters, Evaporation, Soil moisture, Transpiration, Water loss, Estimating equations, Meteorology.
Identifiers: *Rolling topography, North Appalachian Experimental Watershed(Coshocton Ohio), Bowen ratio, Evapotranspiration estimation, Roughness length parameter.

This study was conducted on a watershed with a slope of 13 percent, consisting of rolling-surface topography, located in the North Appalachian Experimental Watershed, Coshocton, Ohio. Detailed micrometeorological measurements were made during selected days throughout 1969 using a lysimeter in order to test the application of commonly used meteorological methods of estimating evapotranspiration under conditions of rolling terrain. The Bowen ratio energy budget method proved superior to the stability-adjusted aerodynamic methods in comparing hourly lysimeter flux rates. Computations agreed with the lysimeter for bare soil and for corn 75 cm high. However, for corn higher than 75 cm, the roughness length parameter was adjusted to an unusually low value of 1.0 cm in order to best fit the combination equation. Methods are presented for making probable-error analysis of evapotranspiration estimates through meteorological methods. (Robinett-Arizona)

Descriptors: Hydrologic data, *Streamflow, *Floods, *Low flow, *Average flow, *Pacific Northwest U.S.
Identifiers: Average, *Flow correlations, Ungaged streamflow.

Research conducted on the water resources of six State Water Program study areas for the Washington Department of Ecology has exposed numerous opportunities for improving methods of hydrologic analysis for ungaged streams. Gaged streamflow characteristics within hydrologic provinces display relationships with respect to particular physical parameters of their drainage basins. Floods are more difficult to correlate with basin parameters than are low flows. But, low, average annual, and flood flows can be related with each other for basins within hydrologic provinces. The low flow of an ungaged stream is determined using the basin-geomorphic parameter method. The average annual flow is estimated from a plot of average annual precipitation and drainage area for gaging stations in the province. By knowing both the low and average annual flows, two-year and 50-year flood flows can be quickly determined. Many options for determining ungaged streamflows are opened by having these correlations of low, average, and flood flows available. Results of a research project on the relationships between low, average, and flood flows for selected stream gaging stations in the Pacific Northwest are presented. (Bechard-Washington State)

SUMMARY OF FLOODS IN THE UNITED STATES DURING 1969,
Geological Survey, Reston, Va.
J. K. Reid.
Available from Superintendent of Documents, GPO, Washington, DC 20402, price $1.90. Water-Supply Paper 2030, 1975. 173 p, 57 fig, 44 tab, 41 ref.

Descriptors: *Floods, *United States, *Flood data, *Flood damage, Hydrologic data, Streamflow, Peak discharge, Flood flow, Storms, Hurricanes, Tidal effects, Flood stages.
Identifiers: *Floods(USA-1969).

The most outstanding floods in the United States during 1969 are described in chronological order. The areas most seriously affected by flooding were: Central and southern California (January and February); the upper Midwestern States of North Dakota, South Dakota, Minnesota, Iowa, Wisconsin, and Illinois (April); north-central Ohio (July); Mississippi, Alabama, and Virginia (Hurricane Camille in August); and Florida and Georgia (September). Hurricane Camille was the most intense hurricane on record to enter the United States mainland. It struck the Mississippi-Alabama coast on August 18, with tidal waves as high as 25 feet above mean sea level and wind velocities more than 190 miles per hour. Tidal wave and flood damage was about $1.3 billion. In Mississippi the known dead totaled 139 and 76 other persons were missing. The hurricane caused record-breaking floods of streams also in a 50-mile-wide area from Sulphur Springs, W. Va., to Fredericksburg, Va. Total flood damage in Virginia exceeded $116 million. There were 113 known deaths, 102 injuries, and 39 people missing. (Woodward-USGS)

A SCHEME FOR STOCHASTIC STATE VARIABLE WATER RESOURCES SYSTEMS OPTIMIZATION,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
V. T. Chow, D. H. Kim, D. R. Maidment, and A. T. Ula.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-247 299, $5.50 in paper copy, $2.25 in microfiche. Illinois Water Resources Center, Urbana. Research Report No 105, October 1975, 102 p, 18 fig, 6 tab, 71 ref, append. OWRT B-084-ILL (2) 14-31-0001-4080

Descriptors: *Dynamic programming, *Optimization, *Systems analysis, *Model studies, Streamflow, Synthetic hydrology, *Stochastic processes.

The development of an analytical scheme for the formulation and optimization of water resources systems is described. The scheme being proposed and investigated is to model the stochastic input of annual as well as monthly streamflows to a hydrologic and water resources system, to formulate the system in a state variable format, and to optimize the stochastic state variable model so formualted by dynamic programming. For annual streamflows, a second-order autoregressive model with a data-based transformation is proposed, and both the maximum likelihood method and the Bayesian approach are used for estimating the model parameters. For monthly streamflows, two linear models are proposed, one is the regression model and the other is the functional relationship model, and their consideration of both uncorrelated and correlated errors and their techniques of generation by a stationary Markov process are discussed. The proposed state variable approach provides a generalized framework within which many different kinds of system models may be expressed and combined for the representation of a given hydrologic and water resources system. This simple yet general format is a major advantage of the proposed state variable modeling. While the annual or monthly streamflows are generated as stochastic inputs to the state variable system model by the proposed scheme, a new procedure of optimization of the system by stochastic dynamic programming is developed. Although the research effort should be further extended to the development of practical procedures for application, a few simple examples are given to illustrate the validity of such applications.

HYDROGEOLOGY OF GLACIAL DEPOSITS IN TIPPECANOE COUNTY, INDIANA, SYSTEMATIC DEVELOPMENT OF METHODOLOGIES IN PLANNING WATER RESOURCES IN MEDIUM SIZE COMMUNITIES,
Purdue Univ., Lafayette, Ind. Dept. of Geosciences.
A. M. S. Marrouf, and N. Melhorn.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-247 093, $6.00 in paper copy, $2.25 in microfiche. Purdue University Water Resources Research Center, Technical Report No 61, June, 1975. 107 p, 26 fig, 9 tab, 50 ref, append. OWRT C-3277(No 3713) (7).

Descriptors: *Groundwater Resources, *Groundwater basins, *Glacial aquifers, *Aquifer management, Geohydrology, Glacial drift, Outwash, Pleistocene epoch, Groundwater, Water sources, Groundwater availability, Water supply, Perched water, Hydrologic budget, Underground streams, Water storage, *Indiana.
Identifiers: Illinoian glacier, Wisconsin glacier, Teays River Channel, glacial Lake, Lafayette, Wabash River drainage, Tippecanoe County(Ind).

The unconsolidated glacial deposits of Tippecanoe County average about 200 feet in thickness. Analysis of subsurface data indicates that the pre-Pleistocene drainage system does not coincide with the present drainage network. The most significant aquifers occur in the glacial drifts. Illinoian age outwash deposits are the most extensive and most highly developed aquifers, but pre-Illinoian and Wisconsin outwash aquifers are also extensive and have not been significantly utilized. In this report, the distribution of aquifers are mapped and their lithologic, stratigraphic, and hydrogeologic aspects analyzed. Most water wells in the county are less than 200 feet and yield from 5 to 2000 GPM. The present total pumpage is about 35 MGPD, and there is no apparent long-term continuous decline in water level. Future development of groundwater resources in the Lafayette Urban Area is most favorable in unexploited areas of thick sand and gravel aquifers which occupy the Teays, Anderson, Clarks Hill and other pre-glacial valleys in bedrock. Limited geochemical data suggest that there is no significant deterioration of water quality. Future land use planning should recognize the location of the most promising aquifers to protect the groundwater reserves.

UNIQUENESS OF A MODEL OF STEADY STATE GROUND-WATER FLOW,
Nevada Univ., Reno. Desert Research Inst.
R. L. Cooley, and P. J. Sinclair.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-247 097, $4.00 in paper copy, $2.25 in microfiche. Water Resources Research Center, Reno Hydrology and Water Resources Publication No 22, August 1975. 39 p, 6 fig, 9 tab, 17 ref. OWRT A-054-NEV (1) 14-31-0001-4028.

Descriptors: *Aquifer characteristics, Hydrologic budget, Mathematical models, *Base flow, *Groundwater movement, Model studies, *Nevada.
Identifiers: *Truckee Meadows(Nev).

The main objective was to investigate the conditions necessary to determine bounds on values of the hydrogeologic parameters which characterize a model of steady-state, areal, near surface ground-water flow. A second objective was to develop a quantitative characterization of the ground-water flow system in Truckee Meadows, Nevada. An inverse method of determining the parameters was employed allowing the parameters to be calculated from the known hydraulic head distribution. Results showed that data collection and use of a reliable inverse method are complementary. Early application of an inverse method to a study would indicate areas where data are contradictory or inadequate and where the gathering of additional critically placed data should (if possible) continue until there is no material change in results of the model. At this point, provided the model is theoretically adequate, the data can be sufficient. (Fallon-Nevada)

GROUND WATER IN SELECTED AREAS IN THE KLAMATH BASIN, OREGON,
Geological Survey, Portland, Oreg.
A. R. Leonard, and A. B. Harris.
Oregon State Engineer, Salem, Ground Water Report No 21, November 1974. 104 p, 14 fig, 5 plates, 10 tab, 12 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Aquifer characteristics, *Water quality, *Oregon, Water wells, Well data, Water yield, Groundwater recharge, Water level fluctuations, Chemical analysis, Water supply.
Identifiers: *Klamath basin(Oreg).

Groundwater features of six lowland areas in the Klamath Basin of Oregon--Klamath Marsh area and Sprague River, Swan Lake, Yonna, Poe, and Langell Valleys--are described. Rugged mountains and ridges surround and separate these lowlands where floors range in altitude from 4,100 feet

Valley to 4,600 feet north of Klamath Marsh. six areas extend over a north-south distance miles, an east-west distance of 40 miles, and de an area of approximately 600 square miles. area is semiarid and received about 14 to 18 es of precipitation a year. Extinct volcanoes their extrusions characterize the area. Most tap permeable basalt or cindery rubble ath the lacustrine beds. The depths of wells e from less than 50 to nearly 2,000 feet--most between 100 and 1,000 feet deep. Flowing occur in all areas except Swan Lake Valley. most extensive area of flowing wells is in the gue River valley, where about 25 wells, some ing more than 2,000 gpm, supply water for ir- ion. Water levels in wells fluctuate seasonally 1 to 4 feet. Groundwater in the basin is of ex- nt quality for drinking, irrigation, and most in- rial uses. (Woodard-USGS)

PERSION AS AN INDEX OF RELATIVE DRAULIC CONDUCTIVITY IN SALT-AF- TED SOILS OF THE SUDAN,
rtoum Univ., Khartoum (Sudan). Dept. of chemistry and Soil Science.
. Hamid, and M. A. Mustafa.
derma, Vol 14, No 2, p 107-114, August, 1975. , 1 tab, 16 ref.

criptors: *Hydraulic conductivity, spersion, *Soil dispersants, *Saline soils, *Soil mistry, Infiltration, Percolation, Permeability, Pores, Africa, Salts, Land reclamation, Salinity, Arid lands, Soil types, Electrolytes, Soil chemical properties, Soil management, Alkalinity, Irrigation water, Irrigation effects, Water quality.
Identifiers: Dispersion index, Exchangeable sodium percentage, *Electrolyte concentration, *Sudan, Aridisols, Vertisols.

Experimentation on two samples selected from an Aridisol and a Vertisol showed that relative hydraulic conductivity increased whereas dispersion index decreased as exchangeable sodium percentage decreased and electrolyte concentration increased. The dispersion index was found to account for over 80 percent of the variability of relative hydraulic conductivity of a salt affected sample and could thus be used to predict relative hydraulic conductivity. For tentative use of the presented prediction procedure, a dispersion index of 13 for similar Aridisols and 8 for Vertisols could be used as a guide, suggesting the need for improving irrigation water quality. In addition, the validity of this prediction procedure still remains to be tested on soils in situ before it can be established as a field practice. (Robinett-Arizona)

Identifiers: Short-wave radiation.

An attempt is made to show how soil moisture data acquired by remote sensing from aircraft or satellites may be used to improve human life. Three general regions of the electromagnetic spectrum are being used today in feasibility studies of remote sensing of soil moisture: the visible, or short-wave region; the thermal, or long-wave region; and the radar, or microwave region. One of the primary benefits of remote detection of soil moisture would be prediction of agricultural production. Knowledge of soil-water content can also greatly assist man in coping with the various insect pests that regularly ravage farmlands, and can aid in the prediction of plant disease (water content is one of the most important aspects of the soil environment influencing the growth and survival and soil-borne plant pathogens). Other applications of soil moisture prediction include use in making crop planting decisions, in determining soil erosion probability, and in problems associated with solving the water balance equation for river basins. (Robinett-Arizona)

A FIELD STUDY ON THE RELATIONSHIP OF TEMPERATURE AND ICE TO INFILTRATION AT A SPRAY IRRIGATION FACILITY,
Michigan State Univ., East Lansing. Dept. of Civil and Sanitary Engineering.
T. S. Vinson, and B. E. Davidson.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 516, $5.50 in paper copy, $2.25 in microfiche. Completion Report Institute of Water Research, Michigan State University, November 1975. 121 p, 57 fig, 6 tab, 48 ref, 2 append. OWRT A-079-MICH(1). 14-31-0001-3522.

Descriptors: *Land application of wastewater, *Wastewater management, *Reclamation, Hydrologic cycle, Spray irrigation, Evapotranspiration, Temperature control, Infiltration, Frozen soils.
Identifiers: *Water quality management project, Infiltration, Water movement in frozen soil.

Data on air, surface and ground temperatures, and infiltration were collected from three sites at a spray irrigation area during the first winter spray program. Two contiguous sites received six spray applications during the winter months. A third site was used as a control site and received no spray application. Soil temperatures were monitored at each site using thermistors at depths of 0.0 ft., 0.25 ft., 0.5 ft., 1.0 ft., 3.0 ft., and 10.0 ft. A continuous temperature recorder was used to measure ambient air temperatures. Natural precipitation was recorded by a 'weighing bucket' types rain guage. Spray application was measured by nonweighing rain gauges. Infiltration was monitored by three lysimeters at depths of approximately 1.0 ft., 3.0 ft., and 5.0 ft. at each site.

A WATERSHED SOILS INDEX OF RUNOFF POTENTIAL,
Agricultural Research Service, Coshocton, Ohio.
J. L. McGuinnes, and W. A. Edwards.
Journal of Soil and Water Conservation, Vol 30, No 4, p 184-186, July-August 1975. 3 fig, 1 tab, 7 ref.

Descriptors: *Runoff, *Soil classification, *Indexing, *Soil properties, *Soil science, *Soil types, *Infiltration, *Hydrology, *Permeability, Soil groups, Storm runoff, Infiltration rates, Hydrologic systems, Agricultural runoff, Drainage.
Identifiers: *Runoff potential, *Coshocton(Ohio), *Soils index, Drainage class, Hydrologic response unit.

A method was presented for the systematic classification of runoff potential of soils. The classification was accomplished by means of a soils index. The index was composed of drainage classes ranging from excessively to very poorly drained, and permeability classes ranging from very rapid to very slow. Seven steps were defined in each class. It was demonstrated that good correlation exists between the soil index described and dormant season runoff for ten Coshocton watersheds. The relationship appeared to be independent of soil cover. All of the watersheds were on a corn-wheat-meadow-meadow rotation, and for a given dormant season, cover varied from a scanty wheat cover to heavy second year meadow. (Terstriep-ISWS)

PHYSICAL INTERPRETATION OF THE DIFFUSION EQUATION PARAMETERS ACCORDING TO MARKOV'S STOCHASTIC PROCESSES THEORY,
Louvain Univ. (Belgium). Dept. de Genie Rural.
C. Laroussi, and L. De Backer.
Soil Science, Vol 120, No 3, p 169-173, September 1975. 2 fig, 7 ref.

Descriptors: *Diffusion, *Unsaturated flow, *Porous media, *Markov processes, *Darcys law, Continuity equation, Diffusivity, Boundary processes, Fluid mechanics, Analytical techniques, Flow.
Identifiers: *Diffusivity coefficient, Moisture profiles.

This study dealt with the derivation of the diffusion equation by considering the displacement of a fluid particle through an unsaturated porous medium as a Markov's stochastic process. The comparison of this equation with that obtained from the combination of Darcy's generalized equation and the equation of continuity allowed assessment of the physical significance of the diffusivity coefficient as well as its partial derivative. The diffusivity coefficient represents the ease with which the fluid particles spread from a zone of high fluid content and it is essentially a function of flow conditions. The physical interpretation of these parameters may be related to the boundary conditions of the flow phenomenon and can help in determining the field of application and the validity limits of the diffusion theory. (Singh-ISWS)

A NOTE ON THE MOISTURE DIFFUSIVITY OF SATURATED SWELLING SYSTEMS FROM DESORPTION EXPERIMENTS,
Connecticut Agricultural Experiment Station, New Haven. Dept. of Ecology and Climatology.
J. Y. Parlange.
Soil Science, Vol 120, No 2, p 156-158, August 1975. 1 fig, 10 ref.

Descriptors: *Soil water movement, *Saturated soils, *Sorption, *Diffusivity, *Mathematical studies, Soils, Soil water, Soil moisture, Soil properties, Moisture, Moisture uptake, Optimization, Infiltration rates, Moisture availability.
Identifiers: *Moisture diffusivity, *Swelling soils, *Nonswelling soils, *Desorption experiments, Sorptivity.

Relations between sorptivity and diffusivity derived for nonswelling materials have been applied recently to swelling materials. It was shown that such applications are invalid and that relations that are specific to swelling materials must be used. A possible relation between sorptivity and diffusivity for swelling materials was proposed for the case of desorption. The results were used to reinterpret experimental observations. (Prickett-ISWS)

EFFECT OF ABRUPT TEXTURAL CHANGE ON POTENTIAL PROFILES DURING STEADY-STATE INFILTRATION,
Iran Plan Organization, Tehran.
M. Bybordi.
Soil Science, Vol 120, No 2, p 92-95, August 1975. 4 fig, 11 ref.

Descriptors: *Soil water movement, *Infiltration, *Soil properties, *Potential flow, *Soil moisture, Water table, Mathematical studies, Analytical techniques, Moisture content, Moisture availability, Soil pressure, Hydraulics, Moisture tension, Hydraulic conductivity, Soil types, Steady flow, Soil texture, Percolation, Infiltration rates, Groundwater movement.
Identifiers: *Layered soils, *Potential profiles.

The effect of abrupt textural change on the shape of the steady-state potential profiles in a layered porous medium was examined both theoretically and experimentally. It was shown that a variety of shapes are possible, depending on the rate of flow, layering sequence, and the hydrologic properties of the layers. Three distinct shapes of the potential profiles and the requirements for their development in a two-layered system were discussed. (Prickett-ISWS)

Identifiers: *Infiltration measurement, Two-phase infiltration, Soil air pressure, Macroporosity, Surface water head, Air counterflow, Initial conditions.

Several similar closed-top infiltrometers were designed and used to simulated effective surface heads ranging from minus 3 to plus 1 cm of water. Design was based on the principle that natural positive soil air pressure may be simulated by creating an equivalent negative air pressure above ponded surface water. Effective surface head h sub s, defined as the difference between the ponded water depth h sub w, and either the actual or simulated soil air pressure head h sub a, is negative when h sub a is greater than h sub w. Under natural field conditions, negative h sub s often causes counterflow of soil air during water infiltration. Narrow ranges in h sub s surrounding zero greatly affect infiltration by controlling air and water flow in soil macropores and weakly hydrophilic micropores. Thirty-minute cumulative infiltration increased 19% per centimeter increase in h sub s for one soil and 33% per centimeter for another soil. Closed-top infiltrometers make possible realistic infiltration measurements under the negative h sub s commonly produced by rain and irrigation waters as they infiltrate natural soils. These devices may also be useful in studying the infiltration effects of several interacting parameters that are related to h sub s, including soil surface macroporosity and roughness, macropore space extent and continuity, antecedent soil air and water, surface wettability and water repellency, wetted surface area and shape, and surface crust and slope. Identifiers: *Soil mapping, Fragiochrep Fragiaquepts, Dystochrepts, Periglacial, S morphology, Hillslope, Cirque-like basin, Val bottom.

Morphologically the soils in Hemlock Cre watershed are related to geomorphic developm since glaciation. Initial drift deposits covering 75-ha area in south-central New York w modified by mass movement (solifluction) then altered by fluvial aggradation-degradat under a periglacial environment and by erosion more recent times. Eight soil profiles represen tive of the geomorphic components forming watershed were evaluated. Fragiochre dominate the shoulder, backslope, and upper fo slope components. They are also the major s on congeliturbate terraces and on step-treds of upper basin. Fragiaquepts are common on lower footslope and toeslope components and a occur on portions of the step-treads of the cirq like basin. Fragipans have formed in both gla till and congeliturbate deposits, indicating pedologic origin. Structural expression and dens of the pans increase with a decrease in natu drainage in both deposits. Dystrochrepts are do nant soils on the summit and on the intermedi level fluvial terraces; entisols occur on the l level alluvial terraces. Pan formation was thou to be precluded by nearness of bedrock (less t 1 m) to the surface in the summit area and matrix textures in the fluvial terraces. Str graphic changes that produce distinct discontin ties in fluvial terrace profiles were readily evid Incipient stratification in congeliturbate depo appeared to affect soil morphology, especi horizon thickness, in these relatively young s (Lee-ISWS)

E DYNAMICS OF NUTRIENT LIMITATION
PHYTOPLANKTON ALGAE: A MODEL
CONSIDERED,
sas Univ., Lawrence. Dept. of Systematics
Ecology.
J. O'Brien.
logy, Vol 55, No 1, p 135-141, 1974. Illus.

scriptors: *Phytoplankton, Eutroplication,
rient requirements.

model of phytoplankton nutrient dynamics
ilar to that proposed by Dugdale (1967) simu-
s the dynamics of phytoplankton-nutrient in-
actions in lakes. Phytoplankton population
shes similar to those commonly observed in
ing phytoplankton blooms occur during simula-
tion whenever large amounts of the limiting nutrient are initially provided. The model shows the phytoplankton death rate as an important influence on the steady state nutrient concentration and population density. Zooplankton grazing appears to be potentially important in triggering blue-green algal blooms and in maintaining high phytoplankton species diversity; phytoplankton mortality caused by settling may be a factor in the seasonal succession of plankton algae. Two potentially confounding factors-nutrient regeneration from dead cells and multiple limiting nutrients-are shown to have no significant effect on the properties of the model--Copyright 1974, Biological Abstracts, Inc.

SOLUTE BALANCE AT ABERT AND SUMMER LAKES, SOUTH-CENTRAL OREGON,
Geological Survey, Reston, Va.
A. S. VanDenburgh.
Available from Supt. of Documents, GPO, Wash., DC 20402 price $2.35. Professional Paper 502-C, 1975. 29 p, 14 fig, 1 plate, 10 tab, 24 ref.

Descriptors: *Dissolved solids, *Saline lakes, *Oregon, *Chemical analysis, *Hydrologic data, Impoundments, Inflow, Surface waters, Groundwater.
Identifiers: *Albert Lake(Oreg), *Summer Lake(Oreg), *Closed basins.

Neighboring Abert and Summer Lakes occupy the broad flat floors of deep, topographically enclosed basins in the high desert of south-central Oregon. The two saline lakes and their tributary areas provide contrasting hydrologic environments well suited to an investigation of the various aspects of solute economy. Exclusive of direct precipitation, Lake Albert received about 90 percent (62,000 acre-ft) of its average annual water supply from the snow-fed Chewaucan River. Summer Lake, in contrast, derives about 74 percent (67,000 acre-ft per year) of its inflow from Ana Springs via Ana River. Prior to impoundment of the river and inundation of the springs, the annual contribution averaged about 100,000 acre-feet (83 percent of the total). The Chewaucan River at its mouth carries an average of about 120 mg/litre of dissolved solids, whereas the flow of Ana Springs contains 160 mg/litre. The relation between incoming and stored solutes at the two lakes contrasts sharply. Total salts and chloride stored in Lake Albert and within the top 5 feet of bottom and playa sediments are, respectively, 8,000 and 16,000 times the average present-day income, whereas comparable values at Summer Lake are only about 1,000 and 2,000 (the higher values for chloride reflect its enrichment relative to carbonate and bicarbonate). (Woodward-USGS)

LAKES OF OREGON: VOLUME 3. HOOD RIVER, MULTNOMAH, WASHINGTON, AND YAMHILL COUNTIES,
Geological Survey, Portland, Oreg.
M. V. Shulters.
Open-file report, 1975. 93 p, 7 fig, 1 tab, 19 ref.

Descriptors: *Hydrologic data, *Water quality, *Lakes, *Reservoirs, *Oregon, Lake morphology, Chemical analysis, Water temperatures, Water utilization, Bathymetry, Contours.
Identifiers: *Hood River County(Oreg), *Multnomah County(Oreg), *Washington County(Oreg), *Yamhill County(Oreg).

This inventory of 61 lakes and reservoirs in Hood River, Multnomah, Washington, and Yamhill Counties, Oregon, includes data in hydrology, water quality, water use, and a bathymetric map for each lake. The report provides information for use by city, county, and State planning groups as well as for sportsmen, tourists, and others interested in preserving the recreational value of Oregon's lakes. In addition to office compilation of existing data, each lake was also visited. Most visits were made in summer or early fall when lakes were most accessible and when water temperature and biological activity were at a maximum. (See also W75-03968 and W74-06270) (Woodward-USGS)

AN INTRODUCTION TO THE PROCESSES, PROBLEMS, AND MANAGEMENT OF URBAN LAKES,
Geological Survey, Menlo Park, Calif.
L. J. Britton, R. C. Averett, and R. F. Ferreira.
Circular 601-K, 1975. 22 p, 6 fig, 1 tab, 50 ref.

Descriptors: *Lakes, *Water quality, *Water pollution sources, Reviews, Water pollution effects, Chemical properties, Physical properties, Biological properties, Thermal pollution, Eutrophication, Sedimentation, Water pollution control.
Identifiers: *Urban lakes, Lake management.

The multiple uses of lakes have made them susceptible to water-quality problems such as algal blooms, sediment deposition and fish kills. These problems are products of the eutrophication process (enrichment, aging and extinction of lakes), which is often accelerated by man. Therefore, it is important to understand the properties and processes of lakes which govern lake enrichment, and the measures available to control enrichment. Lakes are described in terms of their physical (light penetration, temperature, sediment, and morphology), chemical (chemical constituents, plant nutrients, and dissolved gases) and biological (plankton, benthos, and nekton) properties. These properties are all interrelated, and are important variables to evaluate water quality. In addition, lake processes, such as photosynthesis, respiration, eutrophication, and biogeochemical cycling, are important factors in determining the sources and extent of enrichment, and managing a lake for maximum benefit. (Woodard-USGS)

DEVELOPMENT AND ECOLOGY OF SKUJA IN THE SWEDISH LAKE TRUMMEN,
Lund Univ. (Sweden). Limnological Inst.
G. Cronberg.
Sven Bot Tidskr. Vol 67, No 1, p 59-64, 1973. Illus.

Descriptors: *Water pollution, *Lakes, Algae, Spores, *Reclamation, Europe.
Identifiers: Akinetes, Lake Trummen, Raphidiopsis-Mediterranea, Sweden, Skuja.

R. mediterranea was recorded for the first time in Sweden in Lake Trummen, a polluted lake which now is being restored. The alga was followed for several years. At its maximum development the alga occurred abundantly. It showed great seasonal variability and developed akinetes with spores. Earlier discrepancies on the morphology were apparently caused by differences in the state of development.--Copyright (c) 1974, Biological Abstracts, Inc.

CHYDORID (CLADOCERA) ECOLOGY: SEASONAL PATTERNS AND ABUNDANCE OF POPULATIONS IN ELK LAKE, MINNESOTA,
Tennessee Univ., Knoxville. Dept. of Zoology.
M. C. Whiteside.
Ecology. Vol 55, No 3, p 538-550, 1974. Illus.

Descriptors: *Crustaceans, Aquatic populations, Distribution patterns.
Identifiers: Elk Lake(Minn).

Population dynamics of chydorids from Elk Lake, Minnesota (USA) were followed from May through Oct. 1971 by means of 3 collecting methods. Emphasis was placed on data obtained by use of artificial substrate. This method was found to collect most species of chydorids living in the underlying substrate. A 2nd method, funnel trapping, collected animals that migrated 10-20 cm vertically from their substrate into the funnel traps. Funnel trapping was found to be not very efficient at collecting all chydorid species, but to be useful for following overall population trends and for exploring the vertical movements of some species. A 3rd method, called pattern sampling, was tried experimentally. It appears to collect most chydorid species, and also shows the micro-distributions (or spatial arrangements) associated with population densities. Most chydorid species increase in population numbers during spring and fall, and decrease during midsummer. Chydorids have clumped or contagious patterns that fit the negative binomial distribution. A log/log relationship exists between estimates of the mean and variance over the sampling interval, May-October; this relationship established a relatively constant structural arrangement patterns as reflected by the exponent k of the negative binominal, and by b of Taylor's power law. There are several possible explanations for chydorid clumping-heterogeneous habitat, aggregation about food sources, predation, lack of dispersal and behavior. Future studies will be directed at evaluating the relationships between spatial patterns and population densities.--Copyright 1974, Biological Abstracts, Inc.

ZOOPLANKTON COMPETITION AND PREDATION: AN EXPERIMENTAL TEST OF THE SIZE-EFFICIENCY HYPOTHESIS,
Wisconsin Univ., Madison. Dept. of Zoology.
S. I. Dodson.
Ecology, Vol 55, No 3, p 605-613, 1974. Illus.

Descriptors: *Zooplankton, Competition, Predation.
Identifiers: Daphnia middendorffiana, Daphnia minnehaha, Diaptomus shoshone.

Twelve 42-l plankton cages were used in an alpine Colorado (USA) pond to test the size-efficiency hypothesis: to determine why small herbivorous zooplankton species tend not to coexist with large species. The size-efficiency hypothesis, that large species exclude the smaller ones through competition for food, was not substantiated. An alternate hypothesis extends the understanding of the importance of size-selective predators to include invertebrates selecting small prey. A predaceous copepod Diaptomus shoshone excluded the small Daphnia minnehaha from an association with the large D. middendorffiana within 1 mo. By implication, the predacious copepod is responsible for the absence of the small species in ponds occupied by the large Daphnia species.--Copyright 1974, Biological abstracts, Inc.

FRY DISTRIBUTION IN THE LOWER SVIYAGA BAY OF THE KUIBYSHEV RESERVOIR, (IN RUSSIAN),
Kazan State Univ., (USSR).
V. A. Kuznetsov.
Gidrobiol Zh. 9(5). 76-80 Illus. 1973.

Descriptors: *Bays, *Fry, Fish, Spawning, Fish reproduction
Identifiers: Bleak, White bream, Bronze, Ide, Kuibyshev, Perch, Pike, Roach, Sviyaga Bay, USSR, Walleye, Zope.

The Sviyaga Bay of the Kuibyshev Reservoir (USSR) is a shallow body of water with an average depth of 3 m; depths to 20 m in individual areas of the former channel of the Sviyaga River. A study of the distribution of bronze bream, roach, ide, zope, white bream, bleak, pike, perch and walleye in the bay revealed that the fry concentrate mainly in places protected against the prevailing winds, where rich aquatic and littoral vegetation develops and zooplankton is more abundant than in open regions. In spring the utilization of the spawning grounds also depends on the character of the winds. The migration of fry from the shore at this time is related to a decrease in water level.--Copyright 1975, Biological Abstracts, Inc.

ntifiers: Fly larvae, Odagmia-Ornata, Simu-
ae, Simulium-Argyreatum, USSR.

migration of fly larvae in the Ligupit River of
Latvian SSR (USSR) involved 89% Simulium
yreatum and 11% Odagmia ornata. Under nor-
l conditions the migration rate was considerably
er at night than in the day. Less larvae were
nd migrating in the bottom layer and on the sur-
e. The majority travelled 2.5-12.5m. As turbidi-
ncreased, the migration rate increased substan-
ly. Under turbid conditions most larvae
grated 10-22.5m. In the bottom layer, the rate
not increase. O. ornata comprised 3.6% of the
grating larvae in turbid water due to its greater
ological plasticity. Adaptability was a factor in
widespread distribution and presence in pol-
ed waters.--Copyright 1974, Biological Ab-

1-0001-4143.

Descriptors: *Streams, *Benthos, *Benthic fauna, Biological communities, Biomass, Aquatic habitats, Depth, Velocity, *Wyoming.

The benthic community present in a stream is dependent upon or regulated by chemical, biological, and physical factors. Three important physical factors which can influence the composition of benthic organisms are substrate, water velocity, and water depth. Four different substrates in a small Wyoming mountain stream were compared as to benthic community structure. The substrate types sampled were silt, sand and fine gravel, coarse gravel, and rubble. Highest mean number and mean biomass were found in the samples taken in rubble. Point and mean velocities also were measured for each sample taken. Greatest mean number and mean biomass were found at mean velocities of 0.50 foot-per-second (0.152 meter-per-second) or higher. Mean depth data indicated a preference by benthic organisms for depths of less than one foot (0.305 meter).

ROOT DEPTH AS A SENSITIVE PARAMETER IN A DETERMINISTIC HYDROLOGIC MODEL,
Agricultural Research Service, Beltsville Md. Hydrograph Lab.; and Agricultural Research Service, Beltsville, Md. Plant Physiology Inst.
C. B. England.
Water Resources Bulletin, Vol 11, No 5, p 1046-1051, October 1975. 4 fig, 14 ref.

Descriptors: *Root zone, *Depth, *Model studies, *Hydrologic aspects, *Root development, Parametric hydrology, Hydrologic data, Watersheds(Basins), Evaporation, Transpiration, Soil moisture, Lysimeters, Groundwater, Percolation, Soil water movement, Pores, Gravitational water, Evaporation pans, Air temperature, Bromegrass, Alfalfa.
Identifiers: *Muskingham silt loam, USDAHL-74 watershed hydrology model, Breakpoint precipitation.

Deterministic models of watershed hydrology require accurate a priori estimates of soil, vegetation, and watershed parameters. Physical fidelity of these values to those of the prototype natural watershed is essential. One vegetation parameter most neglected is plant root activity. Plant roots directly or indirectly affect many hydrologic processes, including evaporation, transpiration, soil moisture, and ground water. One of their more inportant functions is in opening surface- connected hydraulic pathways for rainfall penetration. Numerical trials of computing evapotranspiration and percolation from a 96-inch-deep lysimeter continuously cropped to bromegrass-alfalfa were conducted, using the USDAHL-74 Model of Watershed Hydrology. Comparisons of computed versus observed values indicated that the alfalfa roots had penetrated, or at least were withdrawing water from, the full depth of the lysimeter. The results illustrated the adaptability of the watershed model to soil moisture accounting, its sensitivity to the root depth parameter, and the need for rational determination of input parameters. 2J. Erosion and Sedimentation

EVALUATING IRREGULAR SLOPES FOR SOIL LOSS PREDICTION,
Purdue Univ., Lafayette, Ind.
G. R. Foster, and W. H. Wischmeier.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol. 17, N0 2., p 305-309, March-April 1974. 3 fig, 8 ref.

Descriptors: *Soil erosion, Soil management, Soil conservation, Erosion, Slope stability, Topography, Evaluation, Agriculture, Construction, *Slopes, Degradation(Slope).
Identifiers: Soil erosion prediction.

The effects of slope irregularities on soil erosion by water were analyzed on the basis of recent progress in mathematical simulation of the basic erosion processes. This report presents the analysis and extends it to routine field application. A technique is proposed for evaluating the universal soil-loss equation's topographic factor, LS, for irregular field or construction-site slopes. The technique also provides a means of evaluating the effects of differences in soil erodibility that may be associated with changes in slope steepness. It does not, however, predict deposition that may occur on a slope. Irregular slopes are not accurately evaluated by using average values for slope steepness and soil erodibility in combination with overall length, and additional very helpful detail can be readily obtained. The proposed technique has direct application value both on farmland and on construction sites. (Skogerboe-Colorado State)

INTERSTITIAL WATER STUDIES ON SMALL CORE SAMPLES. LEG 15,
Woods Hole Oceanographic Institution, Mass.
F. L. Sayles, F. T. Manheim, and L. S. Waterman.
In: Initial Reports of the Deep Sea Drilling Project, Volume 20, National Science Foundation, p 783-804, 1973; Washington, D.C. US Government Printing Office. 22 p, 2 fig, 9 tab, 15 ref.

Descriptors: *Connate water, *Sediments, *Chemical analysis, *Pore water, Bottom sediments, Oceans, Core drilling, Analytical techniques, Inorganic compounds, Geochemistry, Temperature.
Identifiers: *Caribbean Sea, Squeezing.

Major and some minor chemical constituents were studied in pore fluids of 123 samples from three drill sites in the Caribbean Sea. Site 147 (Cariaco Basin) yielded pore fluids resembling those from other clayey and rapidly deposited sediment accumulations near shore. Strong depletions in SO4 and substantial depletions in K, Ca, and Mg accompany increases in alkalinity. Toward the bottom of the site, a decrease in the normally 'conservative' (i.e. unreactive) constituents, Na and Cl, reached nearly 10% of about 180 meters depth. The cause of this apparent dilution is still unknown, but it resembles similar dilutions found in other rapidly deposited sediment pockets influenced by proximity to continental masses. At Sites 147, 148, and 149 concentration changes of Ca, Mg, K, HCO3, and SO4 in most samples are compatible with a reaction model based on sulfate reduction, uptake of magnesium on clays, and precipitation of carbonates. The temperature of squeezing affects cation results in all sites. Greatest relative influence of temperature of squeezing occurred for boron, with nearly +50 percent increase in clayey-marly strata. In contrast to previous expectations, temperature-related anomalies were only slightly lower for highly calcareous sediments such as chalks than for sediments described as clays and marls. A CLOSE-INTERVAL FRACTIONATOR FOR SEDIMENT CORES,
Union Carbide Corp., Tarrytown, N.Y. Environmental Science Program.
A. Fast, and R. G. Wetzel.
Ecology, Vol 55, No 1, p 202-204. 1974. Illus.

Descriptors: *Cores, Core logging, Sampling, Sediments.

Extrusion and fractionation are necessary steps for most sediment core analyses. A new device that rapidly fractionates the core sample as it is extruded from the core tube was designed. The fractionator works well with consolidated or fluid sediments. Results indicate that the fractionator gives representative samples with little or no vertical contamination of the core sample.--Copyright 1974, Biological Abstracts, Inc.

EROSION EVALUATION STUDY,
Louisiana Dept. of Highways, Baton Rouge. Research and Development Section.
S. M. Law, and S. J. Vaccaro.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-238 875, $5.00 in paper copy, $2.25 in microfiche. Research Report 76, June 1974. 70 p, 32 fig, 8 tab, 17 ref, append.

Descriptors: *Erosion, *Erosion control, *Laboratory tests, *On-site investigations, Cover crops, Vegetation establishment, Slopes, Embankments, Erosion rates, Rainfall, Rainfall simulators, Simulated rainfall, Mulching, *Louisiana.

New erosion products, such as mulches or chemical additives for retarding soil erosion or promoting grass stand growth, are evaluated each year. The study attempted to develop a laboratory procedure by which these products can be ev ated, as quickly as possible after they appea the market, in order to screen them so that the one can be further tested in the field. In the phase, the products available were installed selected test slopes in north Louisiana and served. In the laboratory phase, the products installed on plots containing grass seed and f izer and observed to obtain seed germination and on soil in test pans and tested under a rain simulator to get some comparative soil loss Wood fiber mulches and chemical soil binde erosion retardants were used. The principal tors affecting the results obtained in the field the weather conditions; the size, shape, and st ness of the slopes; and the types of soil pre Reports and data dealing with the construction operation of rainfall-simulators, erosion re from other studies, and other pertinent info tion were reviewed. An evaluation of the va pieces of equipment or parts of equipment rel to rainfall-simulators was undertaken also. construction details to the rainfall-simu developed were presented in an appendix. Identifiers: *Ohio River basin.

During the water year ending September 30, the Geological Survey maintained 152 statio 95 streams in the Ohio River basin for the stu chemical and physical characteristics of su water. Samples were collected daily and mo at 92 of these locations for chemical-quality dies. Samples also were collected less frequ at many other points. Water temperatures measured continuously at 74 and daily at 4 tions. Daily water temperatures were measu most of the stations at the time samples wer lected for chemical quality or sediment conte far as practicable, the water temperatures

n at about the same time each day. Quantities suspended sediment are reported for 18 sta-s. Sediment samples were collected one or e times daily at most stations, depending on rate of flow and changes in stage of the stream. icle-size distributions of sediments were deter-ed at 14 stations. The stream discharges re-ed for a composite sample is usually the rage of daily mean discharges for the com-ite period. The discharge reported in the tables ingle analyses are either daily mean discharges lischarges obtained at the time samples were ected and computed from a stage-discharge tion or from a discharge measurement. oodward-USGS)

escriptors: *Patents, Water properties, *Salinity, Temperature, *Conductivity, *Water quality, ea water, Equipment, Measurement.
entifiers: Sensors.

e instrument utilizes two conductivity cells, one ll being adapted for measuring the conductivity the water environment acting on the cell, and a cond cell which is a standard cell for measuring e conductivity of a standard sample of water of own salinity. The ratio of the conductivity mea-rements of the two cells is an indication of linity. An output signal is obtained which is pro-rtional to the conductivity ratio and this output gnal is conveyed to a remote location such as by wire link communication. In a preferred con-ruction, first and second electrically insulative embers having spaced apart portions take the rm of first and second thin wall concentric cylin-ers. A standard sample of electrically conducting quid of a known predetermined parameter is con-ined between the two cyclinders. In order to ake electrical contact with the standard sea-ater, first and second electrodes are provided hich are supported by the cylinders and which e in electrical contact with the standard sample. he cylinders are of a size to permit rapid heat ansfer to the standard sample, while still main-ining high mechanical strength. With a known relationship between conductivity and tempera-ture, a reading of the conductivity of the standard cell gives an indication of temperature. Thus an extremely rapid thermister or temperature sensor is provided. (Sinha-OEIS)

GENERAL MODEL TO SIMULATE FLOW IN BRANCHED ESTUARIES,
Geological Survey, Reston, Va.
J. P. Bennett.
Reprint from Proceedings of the Symposium on Modeling Techniques, held at San Francisco, Calif, September 3-5, 1975: American Society of Civil Engineers, p 643-662, 1975. 4 fig, 5 tab, 8 ref.

Descriptors: *Model studies, *Tidal streams, *Estuaries, *Discharge(Water), *Streamflow, forecasting, Computer models, Methodology, Input-output analysis, Channel flow, Correlation anaylsis, Columbia River, *Oregon.
Identifiers: *Willamette River(Oreg).

The model simulated the time history of stage and discharge in any estuary that can be idealized as a system of interconnected one-dimensional open channels. A unique coding system included in the model input as a part of the description of each cross-section enables the solution algorithm to treat any network of channels without modification of Fortran coding. There are no restrictions as to the number of reaches or junctions that can be considered because the algorithm computes stage and discharge for each cross-section without reference to its location in a particular channel reach or at a junction. Application of the model is illustrated using an extensive data base collected in the Portland, Oregon, harbor on the Willamette and Columbia Rivers. The harbor is idealized as a set of seven interconnected one-dimensional channels. After calibration, the model reproduces observed stages to within a RMS error of 0.2 ft, and discharges to within a RMS error of less than 50 percent of the average absolute value. (Woodward-USGS)

Descriptors: *Stratigraphy, *Continental shelf, *Northeast US, *Sediment distribution, Geology, Geologic time, Hydrogeology, Oil reservoirs, Sedimentology.
Identifiers: *Hydrocarbons, *Oil potential.

A synthesis of studies of sea-floor outcrops of the sedimentary wedge beneath the northeastern United States continental shelf and slope and a reassessment of coastal plain Mesozoic stratigraphy, particularly of the coastal margin, provide insight for estimating the oil and gas potential and provide geologic control for marine seismic investigations of the Atlantic continental margin. The oldest strata known to crop out on the continental slope are late Campanian in age. The Cretaceous-Tertiary contact along the slope ranges from a water depth of 0.6 to 1.5 km south of Georges Bank to 1.8 km in Hudson Canyon. Few samples are available from Tertiary and Late Cretaceous outcrops along the slope. Mesozoic correlations in coastal wells between coastal Virginia and Long Island have been revised. The Upper-Lower Cretaceous boundary is placed at the transition between Albian and Cenomanian floras. Potential hydrocarbon source beds are present along the coast in the subsurface sediments of Cretaceous age. Potential reservoir sandstones are abundant in this sequence. (Woodard-USGS)

A STUDY OF LAGOONAL AND ESTUARINE PROCESSES IN THE AREA OF MERRITT

ISLAND ENCOMPASSING THE SPACE CENTER.
Florida Institute of Tech., Melbourne.
Annual Report July 1972-August 1974. 69 p. (NASA-CR-140601). NGR 10-015-008.

Descriptors: *Estuaries, *Lagoons, Biological communities, *Florida, Systematics, Benthic fauna, Marine bacteria, Nutrients, Winds, Subtropic, Currents(Water), Bottom sediments, Water quality, Water circulation.
Identifiers: *Kennedy Space Center(Fla), *Haulover Canal(Fla), Indian River(Fla), Banana River(Fla), Merritt Island(Fla), Mosquito Lagoon(Fla).

The study of lagoonal and estuarine ecological processes in the vicinity of the John F. Kennedy Space Center on Merritt Island, Florida is described. The island is located at the apex of the three principal components of the lagoonal complex of east central Florida: the Indian River Lagoon (formerly Mosquito Lagoon), the Indian River, and the Banana River. All the waters are saline and near classical examples of lagoons; but in some areas there is an influx of fresh water and the lagoons have an estuarine character. The findings are reported in separate chapters as biological sampling, microbiological studies, physical aspects, sediment analysis, and water quality parameters. The appendix includes a condensation of a thesis by Richard Evan Dill on the circulation in the lagoons around the Kennedy Space Center and condensation of a thesis by David Richard Browne on the transport of water through the Haulover Canal. F. E. Anderson.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-003 549, $4.00 in paper copy, $2.25 in microfiche. Technical Report No 2, February 1974. 45 p, 10 fig, 2 tab, 33 ref. ONR N00014-67-A-0158-0007.

Descriptors: *Estuaries, *Tidal marshes, *Waves(Water), *Suspended solids, Tidal waters, Shallow water, Mud flats, Coastal marshes, Boats, Sediments, Erosion, On-site investigations.
Identifiers: *Boat waves.

A series of boat waves were directed across the tidal flat at varying water depths to compare the different amounts of wave energy expended in each area of the tidal flat and to examine the post-boat wave effects on sediment resuspension and deposition. In general, the outer portion (near low tide mark) of the tidal flat received between one third and one half more wave energy than the shallow region. There was a great deal of energy lost through bottom friction as the wave form passed through shallow water. Because of this energy gradient, the outer portion of the tidal flat appeared to be the most dynamic with alternate periods of resuspension and deposition. In contrast, the inner area was primarily depositional. Near the low tide mark, sediments were easily resuspended--yet just as easily deposited. Their apparent high deposition rates were anomalous for the bottom sediments of the area and it was inferred the sediment particles were behaving more like low density aggregates rather than individual grains of silt or clay. The source of these aggregates may be local pelletization by benthic fauna or physical aggregation caused by reworking of the bottom sediments by waves. (Sims-ISWS)

WAVE HEIGHT INDICATOR LITERATURE SEARCH AND VENDOR SURVEY,
H. Carleton.
Available from the National Technical Information Service, Springfield, Va 22161, as COM-74 11788, $3.50 in paper copy, $2.25 in microfiche. National Maritime Research Center, Kings Point, New York, Report NMRC-KP-123, May 1974. 18 p, 6 fig, 23 ref, 1 append. NMRC MA2-4178.

Descriptors: *Waves(Water), *Ocean waves, *Measurement, *Instrumentation, Equipment, Buoys, Oceans, Lakes, Winds, Sampling, On-site investigations, Ships, Weather data, Oceanography.
Identifiers: *Wave height indicators, Wave meters, Wave followers, Deep sea wave meters, Shipborne wave meters.

Heavy weather encountered by ships has resulted in ship and cargo damage, loss of time and many times loss of life. To minimize the adverse effects of heavy weather, ships can reduce speed and change course based on information provided by weather service or routing service organizations. Information provided by these services is derived from observations made by a wide variety of weather stations, including merchant and naval vessels. The data provided by these vessels should be as accurate as the state of the art and financial considerations will allow. Most of the weather data provided by ship observers is generally well instrumented except for the measurement sea state. Wave height and period are visual observations that are difficult to make and have proven to be very inaccurate. It is felt that instrumentation should be provided aboard merchant vessels so that these important parameters can be measured and reported with greater accuracy, especially when heavy weather is encountered. The results of a limited literature search into wave meters that are used aboard ships to observe wave height and wave spectra was reported. Also included was a review of some literature that is available on commercial wave meters that are applicable for use by ships in measuring wave height. (Sims-ISWS)

HYDRAULIC CONSTANTS OF TIDAL ENTRANCES, II: STABILITY OF LONG ISLAND INLETS,
Florida Univ., Gainesville. Coastal and Oceanographic Engineering Lab.
A. J. Mehta, and H. S. Hou.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-004 992, $5.50 in paper copy, $2.25 in microfiche. Technical Report No 23, November 1974. 96 p, 26 fig, 11 tab, 37 ref, 1 append. ONR NR-388-106 ONR N00014-68-A-0173-0020.

Descriptors: *Estuaries, *Tidal effects, *Hydraulics, *Stability, Littoral drift, Scour, Inlets(Waterways), Sediment transport, Channels, *New York
Identifiers: *Tidal inlets, *Long Island(NY).

The report presented the results of an office study related to the susceptibility of a tidal inlet because of the closure of its mouth. The specific examples explored were the inlets on the south shore of Long Island. The closure of an inlet involves consideration of two opposing agencies, namely (1) the onshore wave energy which tends to drive littoral materials toward the entrance, and (2) the tidal flow which attempts to scour this material helping to keep the entrance channel open. These concepts were applied for hypothetical closing of Long Island inlets. A generalized criterion for stability was proposed, and it was found that this criterion could be used to classify inlest ranging in size from a laboratory model to large natural entrances. A STUDY OF LAGOONAL AND ESTUARINE PROCESSES IN THE AREA OF MERRITT ISLAND ENCOMPASSING THE SPACE CENTER--ANNUAL REPORT, 1 JUL. 1973--AUG. 1974.
Florida Inst. of Tech., Melbourne.
Available from the National Technical Information Service Springfield, Va 22161 as PB106 $4.50 in paper copy, $2.25 in microfiche. NASA CR-140601; AR-2, 31 Aug. 1974, 69 p. NGR-015-008.

Descriptors: *Estuaries, *Estuarine environments, *Florida, *Lagoons, Marine animals, Microorganisms, Biological communities, Water quality, Bottom sediments, *Systematics.
Identifiers: *Kennedy Space Center(Fla), *Merritt Island(Fla), Indian River(Fla).

A study was conducted to determine the marine biology and dynamic oceanographic properties of the Indian River in Florida. One of the major areas of concentration involved the compilation of a taxonomic list of marine animals in the river. An important conclusion of the study is that diversity of the benthic community is substantially higher than expected. The effect of major climatic factors on the diversity and structure of the benthic community is analyzed. (See also W76-01894 thru W76-01898).

BIOLOGICAL SAMPLING OF THE LAGOONAL COMPLEX SURROUNDING K (KENNEDY SPACE CENTER),
Florida Inst. of Tech., Melbourne.
K. B. Clark, and J. Thomas.

A Study of Lagoonal and Estuarine Processes
the Area of Merritt Island Encompassing the
ace Center, Annual Report July 1972-August
'4, p I-1--I-15. 3 fig, 4 tab, 4 ref. (NASA CR-
0601). NASA NGR 10-015-008.

scriptors: *Biological communities, *Estuaries,
agoons, Florida, Systematics, Marine animals,
nthic fauna, Invertebrates, Periphyton, Varie-
, Oxidation-reduction potential, Anaerobic
nditions.
ntifiers: Kennedy Space Center(Fla), Merritt
and(Fla), Indian River(Fla).

1974 taxonomic list of marine animals in the In-
n River, Florida, showed that diversity of the
nthic community was higher than expected.
linity eliminated certain major tax such as echi-
ids, asteroids, and scaphopods. Ninety species
re present in benthic grab samples. About 45%
the invertebrate species had boreal or Caroline-
geographic affinites, while other Florida en-
ronments have predominantly Antillean af-
ites. There were 23 species of larger inver-
rates, those on rock substrates, aufwuchs spe-
s, and rare specimens not collected by the grab
mples. Aufwuchs species are seasonal, thus the
al number of species should increase when
asonal studies are completed. Depth, redox
tential, organic carbon, presence of rooted
getation, and sediment significantly affect
versity and community structure. Sediment
dox potential can be used to indicate long-term
ygen availability relative to availability of or-
nic matter in marine sediments. Anaerobic con-
tions occur nocturnally in shallow areas and may
ll some invertebrates, thus limiting species
chness. Significant correlation exists between
dox potential and diversity in samples in grass-
ee areas. Two communities were present: the
rst was a shallow water community dominated by
iplanthera and Cymodoceum, and the second
as less defined. The species occurring are listed.

40601). NASA NGR 10-015-008.

Descriptors: *Estuaries, *Lagoons, Florida, Microorganisms, *Marine bacteria, Aerobic conditions, Anaerobic conditions, Hydrogen sulfide, ulfur compounds, Inhibitors, Nutrient requirements.
dentifiers: Kennedy Space Center(Fla), Merritt sland(Fla).

Activities of the marine type halophilic microorganisms indigenous to, or adventitiously present in vaters adjacent to the Kennedy Space Center, Florida, were studied. When lagoonal water was nriched with nutrient broth and incubated under nerobic conditions, what appeared to be hydrogen ulfide was produced. Experiments indicated that he reactive substance was probably a thiol mercaptan). Bacterial growth occurred when yrosine, histidine, proline, serine, cystine, nethionine, or glycine were used to enrich agoonal water. Several gram negative rod-shaped organisms (both motile and non-motile), cocci, and spirilla were always found. Vibrio, Benecka, Agarbacterium, and Pseudomonas were tentatively dentified. Addition of serine, methionine, and proline; cystine, proline, histidine, and glycine; serine, histidine, cystine, glycine, and methionine caused greater growth. Glycine inhibited growth when either or both cystine and tyrosine were present. Addition or either cystine or methionine to any non-inhibiting combination enhanced growth. Yeast extract was an excellent growth enhancing substance. Ammonium ion was inhibitory to these organisms. Addition of water soluble vitamins had no effect. The lipid extract of yeast extract caused only slight enhancement, but the extracted residue yielded excellent growth. (See also W76-01893) (Buchanan-Davidson--Wisconsin)

PHYSICAL ASPECTS OF THE LAGOONAL COMPLEX SURROUNDING KSC (KENNEDY SPACE CENTER),
Florida Inst. of Tech., Melbourne.
P. S. Dubbelday.
In: A Study of Lagoonal and Estuarine Processes in the Area of Merritt Island Encompassing the Space Center, Annual Report July 1973-August 1974, p III-1--III-3, (NASA CR-140601). NASA NGR 10-015-008.

Descriptors: *Water circulation, *Estuaries, *Lagoons, Winds, Florida, Currents(Water), Wind velocity.
Identifiers: Kennedy Space Center(Fla), Merritt Island(Fla), Haulover Canal(Fla).

The water movement in this lagoon system is essentially wind driven. Transport through Haulover Canal was measured as a function of water level difference at its ends and correlated with wind patterns. The small difference between surface and average current indicated an almost uniform profile. For current from Indian River to Mosquito Lagoon, optimal wind direction was southwest, and from Mosquito Lagoon to Indian River, due north. There was a close relation between local wind and surface current. When wind blew over the lagoon, a stationary vertical velocity profile was established in about 5 minutes; transport caused water pile-up against the shores; and a 'slope current' was formed by this water level difference. The time constant depended on water surface length in flow direction. For crosswinds, stationarity may be established in one hour; for lengthwise winds, stationarity may not occur in the time a given wind pattern is permanent. Wind set-up influences vertical current profile strength and may produce a direction variation of current with depth. Wind driven currents exist in shallow water. (See also W76-01893) (Buchanan-Davidson--Wisconsin)

SEDIMENT ANALYSIS OF THE LAGOONAL COMPLEX SURROUNDING KSC (KENNEDY SPACE CENTER),
Florida Inst. of Tech., Melbourne.
E. H. Kalajian.
In: A Study of Lagoonal and Estuarine Processes in the Area of Merritt Island Encompassing the Space Center, Annual Report July 1973-August 1974, p IV-1-IV5. 4 fig. (NASA CR-140601). NASA NGR 10-015-008.

Descriptors: *Lagoons, *Estuaries, *Bottom sediments, Florida, Sands, Silts, Cores, Carbon..
Identifiers: Kennedy Space Center(Fla), Merritt Island(Fla), Indian River(Fla), Mosquito Lagoon(Fla), Banana Creek(Fla).

Bottom sediments in the Indian River and Mosquito Lagoon areas, Florida, are predominately a fine sand with shell or trace of shell material. Variations with depth and shell layering or bonding occurred frequently in many of the cores. The effect of the burrowing of benthic organisms was often observed. Silt and silty sand occurred at certain locations at deeper water depths. The color of wet sediments ranged from very dark grey to olive. Organic carbon contents of bottom sediments ranged from 0 to 2.4%; the majority of the sediments had values less than 1%. These values compared with sediments of similar texture from other coastal locations. A few chemical stratigraphy studies were made, but no conclusions can be drawn at present. Equipment for testing the filtering aspects of sediments on hypergolic fuels is being set up. (See also W76-01893) (Buchanan-Davidson--Wisconsin)

WATER QUALITY PARAMETERS OF THE LAGOONAL COMPLEX SURROUNDING KSC (KENNEDY SPACE CENTER),
Florida Inst. of Tech., Melbourne.
J. A. Lasater.
In: A Study of Lagoonal and Estuarine Processes in the Area of Merritt Island Encompassing the Space Center, Annual Report July 1973-August 1974, p V-1--V-15. 6 fig, 1 tab. (NASA CR-140601). NASA NGR 10-015-008.

Descriptors: *Water quality, *Lagoons, *Estuaries, Florida, Subtropic, Shallow waters, Rainfall, Evaporation, Sampling, Statistical methods, Temperature, Salinity, Hydrogen ion concentration, Dissolved oxygen, Nitrates, Phosphates, Turbidity.
Identifiers: *Kennedy Space Center(Fla), Merritt Island(Fla), Mosquito Lagoon(Fla), Indian River(Fla), Banana River(Fla).

Merritt Island is located on the east central Florida coast, at the apex of Indian River Lagoon (Mosquito Lagoon), the Indian River, and the Banana River, which comprise a classical lagoon complex of an estuarine character. Circulation and mixing processes are mostly winddriven with prevailing winds and those immediately preceding meteorological events contributing to the chemical concentrations of the water. Sanitary and storm effluents, water from land drainage projects, and rainfall are sources of fresh water. Evaporation rates are high. Prevailing winds are seasonally almost bidirectional, so there is net transport of winddriven water along the longitudinal SE to NW axis. For statistical evaluation, a sampling pattern was selected utilizing latitudinal-longitudinal coordinates of the area; sampling stations were established at the intersection of each minute of arc of latitude and longitude. Temperature, salinity, pH, dissolved oxygen, nitrate, phosphate, and turbidity for 1972 and 1973 were compared; while 1973 was more moist, the average values were within standard deviations for 1972. Differences observed for the same calendar periods for different years reflected prevailing meteorological conditions. There was general consistency in the statistical evaluations which should permit selection of a limited number of sampling stations for longterm studies. GENERALIZED CRITERIA FOR VERIFICATION OF WATER DEVELOPED THROUGH WEATHER MODIFICATION,
Bittinger M. W. and Associates, Inc., Fort Collins, Colo.
E. B. Jones, C. F. Leaf, and W. H. Fischer.
Available from the National Technical Information Service, Springfield, Va 22161 as PB247-124, $6.75 in paper copy, $2.25 in microfiche. Completion Report, August 1975. 154 p, 26 fig, 21 tab, 119 ref, append. OWRT-C-4099(No. 9020) (1).

Descriptors: *Weather modification, *Water rights, Water supply, *Model studies, Water law, Colorado, Montana, New Mexico, Texas, Utah, Wyoming, *Legal aspects.
Identifiers: Developed water, Cold orographic situation, Warm season cumulus.

The filing of a water right based on water developed through weather modification appears to be possible in most of the States operating under the appropriation doctrine. The conditions under which this may be practical are considered. Interviews were conducted with selected water resources officials in the States of Colorado, Montana, New Mexico, Texas, Utah, and Wyoming. Based on their input and the use of existing hydrologic and meteorologic simulation models, general guidelines were prepared. An example for the cold orographic situation is included.

WEATHER MODIFICATION OPERATIONS IN CALIFORNIA, OCTOBER 1, 1972 - SEPTEMBER 30, 1973,
California State Dept. of Water Resources, Sacramento, Div. of Planning.
M. M. Schwartz, and M. W. Peyton.
Report, July 1975. 22 p, 11 fig, 12 tab, 2 plates.

Descriptors: *Weather modification, *Cloud seeding, *California, Permits, Regulation, Governments, Projects, Silver iodide, Artificial precipitation, Precipitation(Atmospheric), Rain, Snow, Meteorology.

Chapter 4 of the California Water Code, which governs the regulation of rain-making and rain-prevention, declares that the state shall encourage scientific efforts to develop, increase, and regulate the precipitation of rain and snow in California. Regulation and control of artificial means of interfering with natural precipitation are, by statute, the responsibility of the Department of Water Resources. Persons undertaking such work must be licensed by the department and, upon completion of their operations, must report the manner and extent of their efforts to the department. The report described weather modification efforts carried out in California from October 1, 1972, through september 30, 1973. Nine licensees engaged in 11 projects. All projects made use of silber iodide in various forms as the active agent to increase precipitation. Three projects used both ground-based and airborne generators, and eight used ground-based generators only. No information was available to enable the department to assess the results of these operations. Excerpts from the California Water Code that pertain to the administration of weather modification projects in the state were included. (Sims-ISWS)

Available from the National Technical Information Service, Springfield, Va 22161 as PB-247 553 $4.00 in paper copy, $2.25 in microfiche. Completion Report, July 1975. 29 p, 16 fig, 2 tab, 8 re OWRT A-059-ARIZ(2). 14-31-0001-5003.

Descriptors: *Seepage control, *Water harvesting *Asphalt, Plastics, Barriers, Testing procedures Aggregates, Materials testing.
Identifiers: Catchments, Reservoir lining Seepage barriers.

This project was concerned with laboratory equipment development, laboratory testing, construction equipment development and field investigation of the APAC (Asphalt-Plastic-Chip-Coated water seepage barrier. The laboratory equipment that was designed and fabricated included hydrostatic testing vessels, slope stability apparatu and tensile testing grips. Three testing methods were utilized and evaluated. The first test method evaluated the hydrostatic puncture resistance the asphalt-polyethylene combination. The te confirmed the hypothesis that the asphalt effe tively increases the puncture resistance of th APAC membrane over that of the pla polyethylene. The second test investigated th slope stability of a protective APAC chip seal. typical 3/8 in. (9.5 mm) cover aggregate remains stable on constructed slopes of 3:1 and 4:1 and th 2:1 slope remained stable up to a surface temperature of 1220F (50C). The third test method evaluated adhesive materials and indicated that Pres tite mastic was the best suited adhesive for sealing polythylene overlaps. Subsequent field investigations resulted in equipment development that i creased construction efficiency in the installation of the APAC membrane. Actual completed fie installations were evaluated and further recommendations are included.

or-dominated geothermal systems such as
lerello, Italy, The Geysers, California, and
sukawa, Japan, yield dry or superheated steam
n exploited. Models for these systems are ex-
ed along with production data and the ther-
ynamic properties of water, steam, and rock.
se systems initially consist of a water and
m filled reservoir, a water-saturated cap rock,
a water or brine-saturated deep reservoir
w a water table. Most water in all parts of the
em is relatively immobilzed in small pores and
ices; steam dominates the large fractures and
s of the reservoir and is the continuous, pres-
-controlling phase. With production, the pres-
is lowered and the water boils, causing mas-
transfer of heat from the rock and its eventual
ng. Passage of steam through already dried
produces superheating. After an initial vaporization of water in the reservoir, the decrease in pressure produces increased boiling below the deep water table. With heavy exploitation, boiling extends deeper into hotter rock and the temperature of the steam increases. This model explains most features of the published production behavior of these systems and can be used to guide exploitation policies. (Woodard-USGS)

WATER CONSERVATION--AN ALTERNATIVE TO SOLVENT DYEING,
Sandoz Products Ltd., Leeds (England).
G. H. Lister.
Journal Society of Dyers and Colourists (G. B.), Vol 88, No 1, p 9-14, 1972. 5 tab, 4 ref.

Descriptors: *Water conservation, *Textiles, *Dyes, Industrial water.
Identifiers: Foam dyeing, Textile industry, Process modification.

To reduce the amount of water used and effluent produced during textile dyeing the dyeing process was conducted by foam. By converting small volumes of water into large volumes of microfoam in the subtrate body by adding a foaming agent to the dye liquor, even distribution of liquor was rapidly obtained. Subsequent heating fixed the dye to give level, well-penetrated color. The principle is also applicable to preparatory and finishing processes. Foam-forming properties and air-solution interfacial tensions of various foaming agents were determined. Even dye distribution was due to foam, not surface tension. Distribution time was an inverse function of the liquor: goods ratio and concentration of foaming agent. No exact mathematical relationship between liquor:goods ratio, foaming agent concentration, and mechanical force was established. Recipes for production of dyeings on various materials are given. Foam enabled application of dyes which cannot be applied by conventional means. Fixation problems occur because foam is a good heat insulator. Fluorescent brighteners can also be added with this technique. The process is technically and commercially viable. A system has been devised that uses only 2.5-5% of the water required for conventional dyeing processes. (Buchanan-Davidson--Wisconsin)

CONSERVING OUR RESOURCES--THE CONTRIBUTION OF CHEMICAL TECHNOLOGY,
J. N. Smith.
Chemistry and Industry (G.B.), p 546-548, June 16, 1973. 1 fig, 2 tab.

Descriptors: *Water reuse, *Recirculated water, *Water conservation, *Sugar beets, Industrial water, Europe, Sludge.
Identifiers: England.

Water reuse techniques adopted by the best sugar industry in Britain reduce effluent from 1200 to 30 tons for every 100 tons of beets processed. Water is removed from beet pulp, then returned to the diffusers. Formaldehyde restricts bacterial activity on organic matter dissolved in circulating water. Transport water passes over screens to remove beet tails; muddy water goes to a thickener where water is decanted for reuse and the precipitated mud is pumped to settling ponds. Because of dissolved organic matter, lime is required to maintain neutrality and avoid corrosion. Water, needed to condense water evaporated during sugar crystallization, can be reused after cooling. Chlorine or hypochlorite is used to prevent growth of slime-forming organisms in recirculated water. Lime sludge is pumped without dilution. Separate water systems are used for turbine oil and alternator air cooling, washwater for beet analysis, and ash conveying. Clarified transport system water is used to wash carbon dioxide from the lime kiln and returned. Cooling of vacuum pumps, air compressors, and fluid couplings is often integrated into the condenser circulation system. Water reuse requires expenditure for the new plant and increased running costs. (Buchanan-Davidson--Wisconsin)

NEW WASTE WATER PRACTICES IN DAIRY PLANTS,
CREPACO, Inc., Chicago, Ill.
R. A. Elliott.
Journal of Milk and Food Technology, Vol 36, No 9, p 453-455, 1973, 3 fig.

Descriptors: *Water reuse, *Dairy industry, *Waste water treatment, Water conservation, Costs, Byproducts, Sludge disposal.
Identifiers: *Dairy wastes, *Cleaning operations, Process modification.

Recent water pollution legislation is requiring that the dairy industry reevaluate present operations in terms of reducing waste water. About 87% of the plants now dump waste water into municipal sewage systems, but increased treatment charges are demanding reevaluation of this method. The advantages and limitations of the cleaning-in-place and high-temperature-short-time systems are described. By proper system engineering, plant cleaning-in-place systems can be very efficient. Waste water loads, water, steam, and chemical composition can be greatly reduced. Plant recovery programs should be established to dispose of damaged or broken cartons and the product in cartons from filling areas. Conveyor lubricants should be used at low concentrations because they contain 25% hexane solubles. Sludge from separators or clarifiers should be collected and not be allowed to reach plant drains. Positive hose shut-offs should be installed to prevent excess amounts of water from going to the drain. Some plants may have to build their own waste treatment facilities. Traditional means of operating must be reevaluated. (Buchanan-Davidson--Wisconsin)

Descriptors: Irrigation, *Photosynthesis, Translocation, *Drought, *Crop production, Water utilization, *Metabolism, Irrigation efficiency, Corn(Field).

Irrigation represents the largest segment of consumptive water use in the U.S. Consequently, improvements in the efficiency of irrigation can have an important effect on the amount of water available for other uses. This research was initiated to determine the physiological limitations to crop yield during drought. The identification of these parameters may provide a way of estimating plant need for irrigation and avoiding unnecessary applications of water. Maize was grown to maturity, and photosynthesis and translocation of photosynthates were studied when drought occurred during grain development. Both carbon-14 labeling of the photosynthetic products and dry weight determinations indicated that net photosynthesis was substantially reduced whereas translocation was relatively rapid during drought. Furthermore, grain production occurred in proportion to the cumulative photosynthesis for the season. It was concluded that photosynthesis was more limiting than translocation to grain fill under dry conditions and that photosynthetic behavior could be used to reflect the need of maise crops for water.

Identifiers: *Trickle irrigation, *Drip irrigation.

A design method for determining the pressure lo and emitter flow ratio for trickle irrigation later is presented. The design method is based up known principles of fluid mechanics. A compu program was written to determine the lateral pr sure loss and emitter flow ratio at a given desi length as a function of pipe size, tree spaci number of emitters per tree, emitter spaci downstream lateral pressure, and lateral slope. F a given set of design inputs, the program can used to determine if the given pipe size will adequate to limit the pressure loss and flow va tion along the lateral to limits acceptable for design lateral length. Identifiers: Bench terraces, Conservation b terraces, Land leveling systems.

Land leveling can increase the water availabl crop production by conserving runoff and the increasing dryland crop yields in a semiarid mate. Land leveling systems (bench terraces conservation bench terraces) were cropped in tinuous grain sorghum, and conservation b terrace watersheds were cropped in a w sorghum-fallow sequence. Conservation b terrace systems were more profitable than b terraces because land leveling costs were less land-leveling systems to be profitable, production must be increased sufficiently to an annual return on leveling construction c For continuously cropped grain sorghum probability of producing high yields (greater 2,000 pounds per acre) was 1 year in 2 on co vation bench terrace benches, 1 year in 4 on b terraces, and 1 year in 9 on sloping, unter plots. tifiers: *Irrigation Runoff Recovery Systems.

design of an Irrigation Runoff Recovery em is demonstrated; it eliminates the need for t-back type of irrigation by using a constant ly stream discharge, a constant discharge the recirculating pump, a constant furrow harge, and a constant number of furrows in set. This is accomplished by irrigating the entire first set from the inflow water and collecting the runoff in a storage reservoir. The remaining sets, except the last one, are irrigated by both the supply stream and the runoff water, recirculated by pump, and the last set is irrigated entirely by pumped runoff water. A technique is provided to determine the number of furrows to be irrigated from the supply and pumped streams, the number of sets and furrows in each set, the volume of storage required in the storage reservoir, and the recirculating pump flow rate. A Fortran IV computer program has been written that gives the system balance for incremented values of supply stream discharge and time of supply stream inflow. A copy of the complete computer program for the design process is available at cost from the writers, upon request. (Robinett-Arizona)

ANCHORING DEVICE FOR A FLEXIBLE SPRINKLER HOSE,
R. H. Kaatz.
U.S. Patent No 3,908,909, 5 p, 7 fig, 15 ref; Official Gazette of the United States Patent Office, Vol 938, No 5, p 2243, September 30, 1975.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation systems, *Irrigation practices, *Irrigation efficiency, Irrigation operation and maintenance, Equipment, Anchors.
Identifiers: Sprinkler hose.

This invention relates to improvements in anchoring devices for a flexible sprinkler hose. Such flexible sprinkler hoses are formed of a flexible material such as plastic and have rows of small perforations or holes along one side for emitting water in a multiplicity of fine streams along the length of the sprinkler hose. The sprinkler hose has a fitting at one end for connecting it to a water source and a fitting at the other end for closing the end of the sprinkler hose. This invention provides an anchoring device in which the anchor pin is swingable between an anchoring position extending transverse to the hose and a storage or transport position in which the anchor pin extends lengthwise of the hose. The anchoring device can be economically formed and easily applied to the flexible sprinkler hose. It is comprised of a one-piece body of resilient plastic material having an intermediate body portion adapted to underly the hose, an elongated anchor pin portion integrally connected at one end to the intermediate body portion by a thin flexible connector, and a hose engaging portion adapted to at least partially encircle the sprinkler hose. WATER USE, SEMINAR DAMASCUS.
Food and Agriculture Organization of the United Nations, Rome (Italy). Land and Water Development Div.
Report of the FAO/UNDP Regional Seminar on Effective Use of Irrigation Water at the Farm Level, Damascus, Syria, 7-13 December 1971, Irrigation and Drainage Paper No 13, FAO, Rome, Italy, 1972. 312 p.

Descriptors: Irrigation practices, Irrigation efficiency, Farm management, Water requirements, Water management(Applied), Agriculture, Drainage, Foreign projects, Foreign countries, Foreign research, Crop production.

tThe main objective of the Water Use Seminar was to bring together senior government officials and experts from the Near East Region, and consultants and FAO officers to discuss and exchange information on their experience in the field of water management and water use in agriculture, specifically those aspects connected with increased effectiveness in water use at the farm level. The seminar was concerned with the determination of water requirements, water application and drainage, water control and management, scheme operation, and farmers' education and comprehension. This report should serve as reference material for those concerned with water use in agriculture in the Region. In view of the importance of experience, the different countries were requested to prepare contributions to each subject of the agenda of the seminar to reflect thei experience. These contributions are included in the technical report under the appropriate chapters. (See W76-01879 thru W76-01891)

THE ROLE OF EFFECTIVE IRRIGATION WATER MANAGEMENT AT THE FARMER'S FIELD,
Food and Agriculture Organization of the United Nations, Rome (Italy).
H. M. Horning.
In: Report of the FAO/UNDP Regional Seminar on Effective Use of Irrigation Water at the Farm Level, Damascus, Syria, December 7-13, 1971. Irrigation and Drainage Paper No 13: Water Use Seminar, Damascus, Water Resources and Development Service, Land and Water Development Division, Food and Agriculture Organization of the United Nations, Rome, 1972. p 10-21, 2 fig, 4 tab.

Descriptors: *Irrigation practices, *Irrigation efficiency, *Farm management, *Water requirements, *Water management(Applied), Irrigation, Irrigation systems, Arable land, Irrigation design, Irrigation programs, Irrigation water, Water resources, Irrigation operation and maintenance, Water sources, Drainage, Irrigation effects, Fertilization, Timing, Water resources development, Planning, Water quality, Water loss, Costs, Agriculture.

In addition to the effective manipulation of soil moisture, proper management of irrigation and drainage also permits the provision of optimum conditions for fertilizer use, the introduction of highly responsive seeds and advanced tillage techniques and practices. The author suggests a new approach towards water development projects: The allocation of scarce water resources and planning of costly water development projects should no longer be based on empirical formulas; instead effective water use in agriculture calls for a new type of complex planning of water resources development in relation to the utilization of other resources, soil fertility, cropping pattern and crop returns. Key factors in water use planning including the amount of water needed, timing of water application, cropping schedules, water quality, and water losses are discussed. The costs of water development for agriculture are basically determined by water needs. The value of irrigation depends basically on the contribution it can make to reach a defined development objective and the effectiveness with which investments can be used. Returns from irrigation investments depend on the effectiveness with which irrigation is used by the

farmers and the know-how and experience of farmers in irrigation practices and modern agriculture. (See also W76-01878) (Robinett-Arizona)

WATER USE IN IRRIGATION PROJECTS IN THE SYRIAN ARAB REPUBLIC,
International Commission on Irrigation and Drainage, New Delhi (India); and Syrian National Committee.
N. Rifai.
In: Report of the FAO/UNDP Regional Seminar on Effective Use of Irrigation Water at the Farm Level, Damascus, Syria, December 7-13, 1971. Irrigation and Drainage Paper No. 13: Water Use Seminar, Damascus, Water Resources and Development Service, Land and Water Development Division, Food and Agriculture Organization of the United Nations, Rome, 1972. p 22-36, 2 fig, 9 tab, 3 ref.

Descriptors: *Irrigation programs, *Water requirements, *Water utilization, *Agriculture, *Water resources, Water sources, Water supply, Irrigation practices, Farm management, Water management(Applied), Irrigation, Irrigation water, Arable land, Drainage, Water quality, Water resources development, Arid lands, Irrigable land, Rainfall.
Identifiers: Syria.

Syria is situated in an arid or semiarid zone with large areas of arable and irrigable lands, with 70% of the population dependent on agriculture and agricultural industries for their living. A brief description is given of soils, precipitation, water resources, the population, irrigation projects, land and water use experimental farms, and water use in Syria. Problems concerning the effective use of water in Syria call for (1) study of the hydrological basins and water yield estimations, (2) a land and soil survey and classification, (3) studies on evaporation suppression, (4) increase in irrigation efficiency, (5) drainage studies, (6) study of various irrigation methods, (7) water quality investigations, (8) an increase in the number of agrometeorological stations, and (9) instruction of farmers on the value of making the best use of water in the field. W76-01880

DETERMINATION OF WATER REQUIREMENTS IN IRRIGATION PROJECTS,
United Nations Development Program. Rome (Italy).
A. Marasovic.
In: Report of the FAO/UNDP Regional Seminar on Effective Use of Irrigation Water at the Farm Level, Damascus, Syria, December 7-13, 1971. Irrigation and Drainage Paper No 13: Water Use Seminar, Damascus, Water Resources and Development Service, Land and Water Development Division, Food and Agriculture Organization of the United Nations, Rome, 1972. p 75-89, 4 fig, 6 tab, 14 ref, 2 append.

Descriptors: *Irrigation efficiency, *Water requirements, *Water supply, *Evapotranspiration, Irrigation practices, Water management(Applied), Irrigation, Irrigation programs, Agriculture, Water loss, Water resources, Water utilization, Crop production.
Identifiers: Water requirement estimation, Blaney-Criddle method.

When determining the necessary level of accuracy for crop water requirements, the various parameters determining the level of accuracy required need to be considered first. These parameters include the magnitude of the project (when the area is very large, accuracy may be low, and vice-versa), and water resources availability. This paper gives an analysis of the elements of the calculations of water requirements, and discusses the verification of the theoretical calculation. The value of experiments in the verification of theoretical calculations is also described. A long-term series method of determining water requirements for an irrigated area using the Blaney-Criddle formula is given. (See also W76-01878) (Robinett-Arizona)

WATER BALANCE STUDIES,
Food and Agriculture Organization of the United Nations, Rome (Italy); and International Atomic Energy Agency, Vienna (Austria). Div. of Atomic Energy in Food and Agriculture.
Y. Barrada.
In: Report of the FAO/UNDP Regional Seminar on Effective Use of Irrigation Water at the Farm Level, Damascus, Syria, December 7-13, 1971. Irrigation and Drainage Paper No 13: Water Use Seminar, Damascus, Water Resources and Development Service, Land and Water Development Division, Food and Agriculture Organization of the United Nations, Rome, 1972. p 90-96, 10 ref.

Descriptors: *Water balance, *Evapotranspiration, *Lysimeters, *Soil water, *Hydraulic conductivity, Precipitation(Atmospheric), Runoff, Water conservation, Water loss, Infiltration, Consumptive use, Water requirements, Crop production, Irrigation, Irrigation water, Soil moisture, Drainage, Tensiometers, Nuclear moisture meters.
Identifiers: Thermocouple psychrometers, Soil water potential.

Studies of crop water use often involve the determination of all the components of the water balance equation: precipitation, irrigation, surface runoff, change in soil moisture storage, evapotranspiration, time, and drainage. The inputs precipitation, irrigation and surface runoff tend to be discrete in character and can be separately determined. Determination of evapotranspiration using lysimeters and the subsequent problems involved are discussed. Through drainage can be calculated if the relationship between hydraulic conductivity and water content, including the value at saturation, is known, the gradient in hydraulic potential is directly measured with tensiometers, and the soil moisture content is also known. The determination of hydraulic conductivity using tensiometers is described along with the thermocouple psychrometer method for measuring soil water potential and the use of the neutron moisture meter for measuring change in soil moisture storage. fiers: *Field application efficiency.

vement of the contribution of irrigation to
production, together with increased
mic and technical efficiency of water utiliza-
can only be achieved by concentrating the
and operation of the system on the primary
se of supply and distribution: optimum field
ation. The long-term water requirement,
arized for the various crops and over the en-
ultivated area, forms the basis for determin-
e necessary supply and the adequacy of
ble resources. In order to evaluate the field
ation idea, it is necessary to briefly analyze
portant factors such as: rainfall, evapotrans-
n, and the field application efficiency. For
um utilization of the water resources it is
sary that complete control exist regarding
ne of availability for one of the resources. In
way a combination of surface water and
dwater supply can be used by having the
supply provided by river diversion, and the
ntal peak supply by groundwater. (See also

kler irrigation may be regarded as the most
le system of irrigation applicable to most soil
opographic conditions and all kinds of crops.
system can be operated manually or automati-
and allows the precise application of water
rding to field capacity and infiltration rate.
ntages ofsprinkler irrigation are: (1) a
num of land grading and surface preparation;
e use of light sandy soils that do not allow
grading and are not suited for surface
ods due to texture and depth of root zone; (3)
omy in water application; (4) multipurpose
f the installation for water application, fertil-
nd pesticide distribution, control of microcli-
and frost protection; (5) little technical knowledge is necessary. Disadvantages include high cost of initial investment and maintenance, although there are less labor costs, and restricted use caused by strong erratic wind and poor quality water. Drip irrigation has many advantages, especially in arid agricultural regions with a limited quantity of irrigation water, and high rates of consumptive use. The ability to regulate the water supply to meet the requirements of the plant and to reduce air and surface evaporation results in reported savings in water up to 50 percent. The use of subirrigation systems and hydroponics is also discussed. (See also W76-01878) (Robinett-Arizona)

INVESTIGATIONS ON SURFACE IRRIGATION METHODS IN THE EUPHRATES BASIN,
United Nations Development Program, Rome (Italy).
I. Petrasovits.
In: Report of the FAO/UNDP Regional Seminar on Effective Use of Irrigation Water at the Farm Level, Damascus, Syria, December 7-13, 1971. Irrigation and Drainage Paper No 13: Water Use Seminar Damascus, Water Resources and Development Service, Land and Water Development Division, Food and Agriculture Organization of the United Nations, Rome, 1972. p 211-227, 7 fig, 6 tab, 10 ref.

Descriptors: *Irrigation systems, *Surface irrigation, *Furrow irrigation, *Border irrigation, *Irrigation design, *Furrow systems, Water management(Applied), Irrigation, Irrigation practices, Irrigation efficiency, Water requirements, Irrigation water, Timing, Planning, Agriculture, Crop production, Cotton, Soil moisture, Irrigation engineering, Consumptive use.
Identifiers: *Euphrates Basin, Billaneh experimental station.

An experiment was carried out in the summer of 1971 at the experimental station of Billaneh (Euphrates Basin) to collect data for the calculation of furrow irrigation parameters. The average daily water consumption of cotton, with 15% losses, was 8-10 mm in the period of peak water requirements. For an irrigation of 60 mm, the best results were obtained using a furrow length of 50 m with a 1.0-1.2 liter/second water flow; and for an irrigation of 80 mm, best results were obtained using a length of 100 m or more and a water flow greater than 1.2 liter/second. A practical method is given for the choice of parameters for furrow irrigation using tables which correlate these parameters with agronomic and hydraulic requirements for irrigation. Experiments carried out for border strip irrigation showed that the method requires a slope of 0.5-1 percent and good microlevelling. The choice of parameters for border strip irrigation also depends on permeability of the soil, the vegetal cover, and the direction of the sowing lines. (See also W76-01878) (Robinett-Arizona)

IRRIGATION ORGANIZATIONS,
Food and Agriculture Organization of the United Nations, Rome (Italy).
J. A. Sagardoy.
In: Report of the FAO/UNDP Regional Seminar on Effective Use of Irrigation Water at the Farm Level, Damascus, Syria, December 7-13, 1971. Irrigation and Drainage Paper No 13: Water Use Seminar, Damascus, Water Resources and Development Service, Land and Water Development Division, Food and Agriculture Organization of the United Nations, Rome, 1972. p 254-266, 13 ref.

Descriptors: *Water management(Applied), *Irrigation programs, *Farm management, *Administrative agencies, *Irrigation water, Irrigation practices, Water allocation(Policy), Legal aspects, Planning, Water control, Water requirements, Water utilization, Irrigation, Agriculture, Governments, Water resources development, Water rights, Economics.

Water development projects for agriculture should be planned in such a way as to ensure the most effective use of water at the farmer's field. The organization and management of the schemes must be able to enforce effective water use throughout the scheme and include the technical, socio-economic, administrative and educational requirements of water management at the scheme and farm levels. This paper discusses the different ways in which the operation and management of irrigation schemes can be organized and the tasks which irrigation should fulfill: national laws should clearly define water and land rights, farmers' rights to the resources, farmers' participation and government's obligations; one single body should be responsible for the management of the system and properly coordinated with the regional, basin-wide and national organizations in charge of water administration in the country; irrigation schemes must by dynamic and change with time; and the government's control and supervision of water use should be established on a legal basis. TRAINING AND EXTENSION FOR EFFECTIVE USE OF IRRIGATION WATER,
Food and Agriculture Organization of the United Nations, Rome (Italy).
W. D. Maalouf.
In: Report of the FAO/UNDP Regional Seminar on Effective Use of Irrigation Water at the Farm Level, Damascus, Syria, December 7-13, 1971. Irrigation and Drainage Paper No 13: Water Use Seminar, Damascus, Water Resources and Development Service, Land and Water Development Division, Food and Agriculture Organization of the United Nations, Rome, 1972. p 267-276.

Descriptors: *Farm management, *Water management(Applied), *Irrigation programs, *Training, *Irrigation efficiency, Administrative agencies, Irrigation practices, Planning, Water control, Water utilization, Irrigation, Agriculture, Governments, Water resources, Economics, Irrigation water, Irrigation efficiency, Water sources, Crop production.

Modern irrigation requires a farmer who is equipped with needed technical skills who can provide and adequately use farm inputs and apply suitable methods of farm management. This paper deals with the need of farmers' training to insure an effective use of irrigation water which is considered the main element in any effort to improve agricultural production. Training of this nature requires, in each country, a well organized advisory system equipped with competent technical and educational staff. This system should provide for close collaboration between technical, educational, and service agencies (such as Agricultural Extension, Research, Education, Cooperatives, and Credits) who assist farmers with technical information and provide them with needed production inputs and marketing facilities. NEAR EAST APPLIED RESEARCH PROGRAMME FOR LAND AND WATER DEVELOPMENT,
Food and Agriculture Organization of the United Nations, Cairo (Egypt). Near East Regional Office.
L. T. Kadry.
In: Report of the FAO/UNDP Regional Seminar on Effective Use of Irrigation Water at the Farm Level, Damascus, Syria, December 7-13, 1971. Irrigation and Drainage Paper No 13: Water Use Seminar, Damascus, Water Resources and Development Service, Land and Water Development Division, Food and Agriculture Organization of the United Nations, Rome, 1972. p 277-284.

Descriptors: *Water management(Applied), *Irrigation programs, *Arid lands, *Water resources development, *Research and development, Water requirements, Water supply, Arable land, Irrigation water, Water resources, Water sources, Agriculture, Planning, Farm management, Training, Administrative agencies, Water utilization, Irrigation, Governments, Foreign research, Land development, Saline soils.
Identifiers: *Near East countries.

Research is necessary for the inventory of water supply and distribution with particular reference to identifying its source, quality, rate and site of the flow, in addition to relating the water characteristics and parameters with those of the soil and in assessing the outcome of their interaction and their interrelation with the other sectors of the agriculture environment. In the semi-arid and arid areas which occur in almost all the Near Eastern countries, the provision of irrigation water and its economic use are two of the most important factors for increasing agricultural production. The majority of countries in the region need experienced manpower in all phases of the reclamation, improvement and management of salt affected and waterlogged soils, water management and control, and land preparation and related mechanized practices. A regional applied research program for land and water development is discussed considering the major benefits which could accrue to all governments from the proposed solutions and recommendations by the program. The program is designed to activate the existing institutional and manpower resources available for research in the countries concerned and seeks to guide and link their efforts, to help overcome organizational and other constraints and to promote training and extension services. 4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

HIERACHICAL MANAGEMENT OF GROUND AND SURFACE WATER SYSTEM VIA MULTICELL APPROACH,
Case Western Reserve Univ., Cleveland, Ohio. Dept. of Systems Engineering.
Y. Y. Haimes.
Available from the National Technical Information Service, Springfield, Va 22161 as PB247-100, $8.00 in paper copy and $2.25 in microfiche. Ohio Water Reserve Center, Columbus, Interim Report, July 1975, 228 p, 25 fig, 40 tab, 44 ref. OWRT B-062-OHIO(1).

Descriptors: *Groundwater, Management, *Aquifer, Surface water, *Mathematical models, System analysis, Water supply, Water table, *Simulation analysis, *Model studies, *Ohio.
Identifiers: *Multicell system, Surrogate Worth Trade-Off Method, Sensitivity analysis, Parameter identification, Great Miami River Valley, Miami Conservancy District(Ohio), Fairfield-New Baltimore Area(Ohio), Hierarchical management.

A multicell groundwater simulation model was constructed to use the decomposition techniques for better data utilization, and then modified for the large scale, complex groundwater system. The model was applied to the case study, at Fairfield-New Baltimore area, Dayton, Ohio, and the sensitivity analysis of the model for evaluating the various approaches to the parameter identification problems was discussed. The problem of conjunctive use of ground, surface and other water resources systems was addressed. The complexity of the model was dealt with by using hierarchies of functions to relate various system responses to imposed input. Numerically the model could be solved provided those functions were made available by using a hierarchy of aquifer simulation models, resulting in a quadratic program and coordination scheme as a solution procedure. Next the model was applied to the case study, again the Fairfield-New Baltimore area. The scope of model testing was limited by the actual status of the area under study, but even so the potential applications of the developed model were well illustrated. An example problem was formulated and successfully solved where the conjunctive use of groundwater, streams and a surface reservoir was considered. The study was completed by introducing a multiobjective analysis to that same area. At least three noncommensurable objectives could be identified for water use: (1) minimize cost of water supply, (2) minimize environmental damage caused by lowering stream water level, (3) minimize future energy dependence of water supply. RATIONAL SYSTEMS FOR SNOW MOVAL AND ICE CONTROL: A KGROUND/RESOURCE PAPER FOR THE ER GREAT LAKES UNIVERSITY CONSOR-M FOR TRANSPORTATION RESEARCH,
higan Technological Univ., Houghton, Mich.
. Huang.
ilable from the National Technical Informa- Service, Springfield, Va 22161 as PB-238 935, 0 in paper copy, $2.25 in microfiche. Final re- , August 31, 1973. 6 p, 4 fig, 3 tab, 172 ref. T-OS-30096.

criptors: *Operation and maintenance, *Snow, ow removal, *Ice, *Deicers, *Transportation, hways, Airports, Equipment, Ice-brine ems, *Highway icing, Great Lakes, Snow- s, Michigan, Wisconsin, Minnesota.
tifiers: Snow vehicles, Snow removal ems, Upper Great Lakes Region, Drift con- Chloride salts.

There is a pacuity of research to date on operational systems for snow removal and ice control in the transportation systems in the United States and elsewhere. Though the primary interest of the author is the Upper Great Lakes Region including Minnesota, northern Wisconsin, and Michigan, he indicates that some of the proposed research could apply in other areas. Total expenditures in 1964 were around $200 million on snow and ice control. Research could result in substantial savings as well as increased safety and efficiency of roads. Intermediate objectives are listed: (1) Properties of snow and ice pertinent to removal and control operations must be determined. The major properties are understood and in Japan a classification system dividing snow and ice into 7 groups is used, but this system is not used now as a criterion for snow and ice removal; (2) Performance and efficiency criteria for various types of commonly used equipment need to be established; (3) Effectiveness of chloride salts as well as their social and environmental impacts must be re-evaluated. At present many aspects remain unknown. There are indications that some use of salts can cause rather than correct some dangerous road conditions; (4) The snowdrifting process should be understood under different geomorphological and climatic conditions. Field experiments are necessary under operational conditions; and (5) Models and techniques for the analysis of operational systems for maximum effectiveness of snow removal and ice control must be developed. Organization and training factors have been studied as has the location of maintenance stations, but much more needs to be done in these and related areas. (Smith-North Carolina)

THE RIVER'S REACH: AN ASSESSMENT OF EXISTING FLOOD PROTECTION IN UPSTREAM WATERSHEDS OF THE CONNECTICUT RIVER BASIN.
Soil Conservation Service, Durham, N.H.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 499, $5.00 in paper copy, $2.25 in microfiche. Prepared for New England River Basins Commission. Supplemental study, March, 1974. 68 p, 13 fig, 6 plates, 26 tab, append. CRSS-SCS 1.1D, 1.3D, 1.3E, 1.4D.

Descriptors: Floods, Flooding, Flood flow, *Flood forecasting, *Flood damage, *Watersheds(Basins), *Flood plains, *Connecticut River, *Flood protection, *Vermont, Streamflow forecasting, Flood data, Flood frequency, Peak discharge, Stage-discharge relations, Non-structural alternatives, Flood plain zoning, Flood plain insurance, Land use, Dikes, Dams, Channel improvement.
Identifiers: Connecticut River Basin(Vt), Passumpsic River(Vt), Whetstone Brook Watershed(Vt), Mill River(Vt), Moose River(Vt), Lyndon(Vt), St Johnsbury(Vt), Battleboro(Vt), Marlboro(Vt), Northampton(Vt), Williamsburg(Vt).

Three watersheds in the Connecticut River Basin were studied to assess existing flood protection and to estimate damages for floods of varying magnitudes. The Passumpsic River Watershed (Vt.) drains 374 square miles and includes the Moose River. Flood damage has occurred 17 times in 150 years, the greatest flood, in 1927, causing $8,927,000 in damages. Development in the flood plain is 32% agriculture, 52% woodland and wetland, 4% urban and 12% miscellaneous. Future flood estimates range from $474,000 in a 10-year flood to $7,510,000 in a 100-year flood. Average annual damage is predicted at $539,200. Lyndon (Vt.) and St. Johnsbury (Vt.) in this watershed both have flood plain zoning ordinances, but existing flood plain development is unprotected. Land use in the Whetstone Brook Watershed (Vt.) is 62% urban, 19% agriculture and 19% miscellaneous. The 1938 flood damages were estimated at $2,887,000. Future flood damage estimates range from $155,000 in a 10-year flood to $3,237,000 in a 100-year flood. Predicted annual damage is $226,800. The town of Battleboro (Vt.) uses state and local regulations to control flood plain development. Marlboro (Vt.) has a flood plain zoning ordinance. The Mill River Watershed drains 59 square miles and land use is 24% agriculture, 20% urban, 44% wetland and woodland, and 12% recreation. The 1938 flood damages were about $860,000 and future damages range from zero in the 10-year flood to $1,135,000 in a 100-year flood. Northampton (Vt.) has a flood management plan, proposed zoning, and a dike and diversion system. Williamsburg (Vt.) is planning control of flood plain use. This report analyses the watersheds in detail and gives many kinds of flood plain protection alternatives. (Smith-North Carolina)

Identifiers: *South Platte River(Colo).

A study was done on the South Platte River in Colorado in order to determine necessary management of the water resources of the valley with respect to water diversions for irrigation and pumping from the valley. A technically sound computation procedure has been developed in order to determine advance quantitative knowledge of what the effect of water resource decisions will be. The equations have been reduced to tabular form and the validity of the computation has been confirmed by testing it against the historic performance of the river. Depletion of the river due to pumping was found to approximate one-fifth of the watershed yield. Computations indicate that the response of river flow to shutting down of wells will be so sluggish that attempts to put wells directly into the priority system will be both ineffective and dangerous. It is concluded that the surface waters and groundwaters of the valley are one water supply since no acceptable flow correlations can be obtained until the return flows to the river from groundwater are accounted for. Identifiers: *Bayesian inference, Cost-benefit analysis.

An analysis of parameter uncertainty and the effects of model uncertainty upon decision making, as applied to flood prediction, is discussed. It is argued that the decision theory approach to making decisions is a more rational approach than other procedures which separate inferences, decisions, and preferences. A case study was presented for the determination of the best level of flood protection for Woonsocket, Rhode Island. Each of three probability models was compared, and the Bayesian procedure was employed. Prior data from a regional regression model, historical data, and realistic flood cost and damage functions were used. A calculation was made of the composite Bayesian distribution of flood discharges, which was then used in conjunction with an appropriate utility function to maximize expected utility and net benefits. The results of the Rhode Island study confirmed the expectation that Bayesian statistical procedures could be used to make engineering decisions. (Kramer-FIRL)

Descriptors: *Overflow, *Storm runoff, *Floods, *Mathematical models, Computers, Economics, Storage.
Identifiers: Transylvania.

Equations are presented for the establishment of overflow spillway discharges in storm water retention basins. Overflow spillway discharge is dependent upon the two variables base and height of the spillway wave, which can be modified so that they correspond to an economic minimum. A network of water storage basins is being designed for the most economical system of flood attenuation for the area of the Transylvanian high plains. The amount of overflow spillway discharge was determined by a mathematical model using a calculus program to optimize the economic solution. The scheme has been integrated into a computer program and its details are graphically illustrated. (Kramer-FIRL)

EFFECT OF VALLEY SHAPE ON RETENTION BASIN PERFORMANCE,
A. R. Pagan.
Public Works, Vol 106, No 8, p 84-85, August, 1975. 4 fig, 1 tab.

Descriptors: *Flood control, *Retention, Outflow, Mathematical models, *Reservoirs, *Storage capacity, Hydrographs, Engineering.

A mathematical model was designed to emphasize the importance of the cross-section profile of the valley behind a flood control structure for engineers responsible for selecting storage reservoir sites. Because the amount of storage available should increase as rapidly as possible with increasing depth in order to get the greatest amount of outflow reduction, a U-shaped valley was suggested to be much more effective in suppressing flood peaks than a V-shaped valley. In order to quantify this, an imaginary stream was assumed as well as an outflow versus depth hydrograph. The following curves were used: inflow hydrograph (same for both V-shaped and U-shaped valleys); storage versus depth curve for V-shaped valley; storage versus depth curve for U-shaped valley; and outflow versus depth curve. From these were constructed storage versus outflow curves for V-shaped and U-shaped valleys and $2S/t + 0$ versus outflow curves for V-shaped and U-shaped valleys. When all these curves were plotted, the standard routing procedure was followed and the resulting outflow hydrographs for each valley shapes were compared. It was determined that the peak outflow for the V-shaped valley was 330 cfs and for the U-shaped valley 245 cfs. The percentage of peak inflow was 36.7 for the V-shaped valley and 27.2 for the U-shaped one. Peak storage capacities were 2.25 million cu ft and 2.95 million cu ft, respectively. A greater amount of land might be needed with less advantage for the less efficient V-shaped storage reservoir. Additionally, the routed peak outflow of the U-shaped valley was 74 percent of that of the V-shaped valley. (Kramer-FIRL)

LONG-TERM FLOOD PREDICTION FROM SHORT-TERM RIVER DATA.
Search, Vol 6, No 7, p 250-251, July, 1975.

Descriptors: *Flood forecasting, *Rainfall-runoff relationships, *Australia, Rainfall, Mathematical models, Statistical models, Streamflow.

The problem of flood forecasting in Australia w
discussed at the Institute of Engineers Hydrolo
Symposium at Armidale In the Queensland ar
streamflow records have only been kept for
past ten years. Because of this, accurate pred
tion of larger, less frequent floods are not feasi
by direct methods. However, the Queensland
rigation and Water Supply Commission
developed an indirect method to give useful lo
term flood forecasts. It was found that ann
flood maxima in a catchment have a very cl
statistical relationship with daily runoff volum
the same catchment. Rainfall records have b
kept for a much longer time than streamf
records. Daily runoff volume correlates with r
fall. The rainfall/runoff relationship belongs t
common family of curves, which can be c
sidered in terms of the parameter K2. The
value was demonstrated to be useful in obtai
long-term flood predictions from long-term rai
records. The method was checked for e
catchments for which about of 30 years
complete records were available. The maxim
one-in-fifty years and one-in-one hundred y
floods were predicted, and the predictions w
compared with those made conventionally f
the full flood record. The differences between
two predictions (on the average) was less t
eight percent. Thus, it may be possible to m
reasonably accurate predictions for o
catchments with only rainfall data. (Kra
FIRL)

procedure has been developed for predicting the eraction of flood waters and structures on the od plain. The hydrodynamic predictor is a odified form of the U.S. Army Corps of En-ineers Program HEC-2. Methods for modifying e input for HEC-2 to account for structures on e flood plain are described. These modifications e principally concerned with roughness and oss-sectional area. Using the results of the drodynamic model a procedure is described for timating the loads on flood plain structures. A ndimensionalized form of the loading has been eful in predicting structural damage. A case udy involving modeling of a flood plain for com-rison with damage resulting from Tropical orm Agnes is reported. The damage survey of a gion sample of 155 flood plain structures is par-ularly useful for evaluation of flood damage iteria. A damage criterion has been proposed sed on these data.

ELATIONSHIP OF DISCHARGE REDUC-IONS TO AVAILABLE TROUT HABITAT FOR ECOMMENDING SUITABLE STREAM-LOWS,
yoming Univ., Laramie. Water Resources esearch Inst.
A. Wesche.
vailable from the National Technical Informa-on Service, Springfield, Va 22161 as PB-247 514, $5.00 in paper copy, $2.25 in microfiche. Water Resources Series No 53, December 1974. 71 p, 22 fig, 6 tab, 30 ref, append.

Descriptors: *Streamflow, *Aquatic habitats, *Trout, *Average flow, *Flow rates, Discharge(Water).
Identifiers: Trout habitat, *Trout cover, Average daily flow, Minimum flow.

This study to determine suitable streamflows to maintain trout habitat focused on defining changes observed for physical stream characteristics as streamflow was reduced. To relate these changes to reductions in available habitat, criteria were developed defining the cover preferences of trout; criteria from the literature were applied for food production and spawning areas. Trout cover has been defined as instream rubble-boulder areas and overhanging bank cover in association with a water depth of at least 0.50 ft (0.15 m). Using these preferences, a rating system was developed allowing comparisons of available trout cover to be made for one stream section at various discharge levels and for different stream reaches at approximately the same level of flow, based upon the average daily flows (ADF) for the sections. Verification of the rating system as an indicator of the standing crop of trout present was initiated in an attempt to quantify the biological significance of instream dewatering in regard to trout populations. The primary study area had an ADF of 78.7 cfs (2.23 cu m/sec) and was intensively investigated at 100%, 71%, 51%, 38%, 27%, and 11% ADF. Available habitat was found to decrease at the greatest rate for the discharge reduction interval from 27% to 11% ADF. These findings verify earlier results on 2 stream sections having smaller ADFs. As a minimum flow to maintain habitat, a discharge in the 25% ADF range will avoid the flow range for which the rate of habitat decrease is greatest.

Bureau of Reclamation, Denver, Colo.
H. H. Ham.
Presented at 1974 Winter Meeting of the American Society of Agricultural Engineers, December 10-13, 1974. Chicago, Illinois. 8 fig, 12 ref.

Descriptors: *Drainage wells, Drainage sysems, Drainage practices, Drainage engineering, Flow systems, Transmissivity, *Subsurface drainage.
Identifiers: *Interfering wells.

Wells are often viewed as an alternative to drains for agricultural subsurface drainage. Where subsurface and other conditions are favorable, wells may offer advantages despite hydraulic and other shortcomings. However, areas of such favorable conditions are limited. Furthermore, improper use of wells may jeopardize long-term productivity of the land. Use of wells for agricultural subsurface drainage may appear advantageous but should be

approached with caution unless investigations have determined that conditions are favorable. (Skogerboe-Colorado State)

Identifiers: Sahuaral Irrigation District(Mexico).

The Sahuaral Irrigation District in Mexico, located approximately 200 miles south of the Arizona-Mexico border, is studied with respect to policy issues associated with the management of the coastal groundwater aquifer and soil salinity. The primary policy issues are the time related rate of use of groundwater supply, the allocation of water between irrigation and leaching, and the selection of crops. In order to give operational form to these problems, a management model, in dynamic programming format, is used which indicates that the aquifer should be mined at a rapid rate near the beginning of the planning horizon, gradually decline through time, and converge to safe yield after 29 years. In addition, more water should be allocated to leaching to maintain soil salinity at lower levels. (Robinett-Arizona)

Descriptors: *Groundwater, *Water table, *Stochastic processes, Statistical models, Surface-groundwater relationshps, Groundwater movement, City planning, Community development, Model studies, Water levels, Water level fluctuations, Aquifers.

The ground water level fluctuations in an aquifer are affected by external causes such as precipitation, outflows from the aquifer, and pumping from the aquifer. Stochastic models are proposed for the fluctuations in ground water levels. Both multiinput-single output and multivariate models have been considered. IN th univariate models, variables such as precipitation, stream flows and others which have been known to affect the ground water levels have been considered as external inputs. The fluctuations in ground water levels and the causal variables are directly built into the multivariate model. The parameter estimation and the residual tests are discussed in detail. The multivariate model was also tested by simulation. The results indicate that the ground water level series can be successfully modeled by stochastic models. These models can be used to evaluate the time lag between precipitation and changes in ground water levels, the effect of the streamflows on water levels in adjacent wells, and the ground water resources in a region. Descriptors: *Underground storages, *Water storage, Groundwater recharge, Groundwater movement, Artificial recharge, *Saline water-freshwater interfaces, *Mixing, *Diffusivity, Dispersion, Transmissivity, *Injection, *Injection wells, Model studies, Computer programs, Aquifers, *Water movement(Applied).
Identifiers: Dispersivity, Gravitational laydown, Miscible displacement, Salaquifers, Isopotential zones, Zones of stagnation, Well-field design, Miniaquifers.

The storage of fresh water in horizontal, confined saline aquifers is technically feasible. Experimental results with physical aquifer models involving single and multiple injection/production wells were used to verify computer programs for: prediction of the recovery efficiency (the ratio of retrieved-to-injected fresh water), frontal position of the fresh water bubble; position of the saline water-freshwater interface resulting from gravitational laydown, dispersion, and mixing, and calculation of the dispersivity. For salaquifers with pre existing groundwater movement, an additional program must be used to design a system of injection/withdrawal bounding wells that will neutralize the movement and create a zone of stagnation for the storage project. Tests on tilted physical systems, with and without pre-existing flow showed that deleterious mixing and water movement could occur in aquifers with more than a few degrees of dip. Besides the determination of the usual in-situ hydrogeologic factors for ground water supply systems, additional tests for porosity, dispersivity, and pre-existing flow are required for the design of an Injection/Storage/Production well field. Each additional I/S/P cycle will result in proved recovery efficiency, regardless of the hydrogeologic parameters. All necessary computer programs are detailed in the appendices. Cost estimates for a hypothetical underground storage system compare favorably to an alternate tank storage project. The construction and calibration of the miniaquifers (artificial porous sandstones composed of uniformly-graded sand and epoxy resin) are described along with the test procedures, equipment, and mathematical bases.

Identifiers: *Alluvial wells, Non-governmental mechanisms.

Colorado has recognized the need for integrated regulation of ground and surface water use into a single legal system which protects appropriative water rights and encourages maximum utilization of the state's water resources. A persistent problem is that of reconciling the rights of ground water users with those of more senior subsurface water oppropriators. Groundwater sources for irrigation are preferred by most farmers. A central concept in the 1969 Water Right Determination and Administration Act is that groundwater di-

ıs should not be curtailed unless the water uld otherwise have been available to senior ap-priators. The Act also provides for three ices available to private parties: the use of ls as alternate points of diversion for surface nts, the use of substituted supplies of water, l the use of plans for augmentation of current ter supplies. Regulation of alluvial wells was un by the State Engineer. Current rules which e withstood court challenges provide for dual curtailment of groundwater diversion un-s the appropriator can insure replacement to the eam of the appropriated water. This approach igates the problem of the anticipatory call. The blem of measuring the amount of replacement ter required remains unsolved. (Jenkins-rida)

STIMATION OF THE DISRUPTIVE IMPACT F SNOWFALLS IN URBAN AREAS,
ueensland Univ., Brisbane (Australia). Dept. of eography.
. R. de Frietas.
ournal of Applied Meteorology, Vol 14, No 6, p 166-1173, September 1975. 2 fig, 6 tab, 13 ref.

escriptors: *Snowfall, *Cities, *Hazards, Canada, Snow, Snow removal, Transportation, now management, Social impact, Economic im-act, Winds, Wind velocity, Temperature, leteorology.
Identifiers: *Disruptive impact.

Study aims were the identification and evaluation of the physical characteristics of snowfall and accompanying weather conditions contributing to a description of the disruptive capacity of snowfalls in urban areas. The study focused on five large urban areas of Canada, but it was hoped that the findings would have much wider application. Stepwise multiple regression analysis was applied to a sample of snow season data to reduce the number of variables needed to describe disruptive impact meteorologically. This was combined with a synoptic diagnosis of daily weather phenomena. Specifically, the results indicated that the disruptive intensity of a snowfall event may be expressed by a minimum of three independent meteorological elements, namely, 24-hour snow accumulation and mean wind speed and temperature during the period of fall. Sediment carried in irrigation return flow usually is considered a pollutant, but small watersheds and drainage basins contain many areas where sediment can be removed from the water and used as an economical source of high quality topsoil for filling low areas and leveling land. Experiments were carried out to determine water flow and sediment deposition in a 1.1-acre pond specifically constructed to trap sediment in a low area near an irrigation return drain. During 1972, 167 acre-feet of water passed through the pond depositing 1,254 tons of sediment (7.51 tons per acre-foot of runoff water or 8.4 acre-inches of topsoil). Between April 29, 1973, and July 8, 1973, 185 acre-feet of water deposited an additional 1,379 tons of sediment (7.45 tons per acre-foot of runoff water). The average elevation for the pond was raised 16 inches, and 85 percent of the sediment in the runoff water was removed when the sediment concentration exceeded 0.1 percent by weight. Trapping sediments in man-made ponds must be considered a short-term measure. Solution of the sediment problem over the long term depends on effective conservation treatment at the sediment source. LIQUID CHROMATOGRAPHIC ANALYSES IN SOIL CHEMISTRY,
Wisconsin Univ., Madison. Water Resources Center.
G. Chesters, and D. A. Graetz.
In: 'Chromatographic Analysis of the Environment,' Robert L. Grob, editor. Marcel Dekker, Inc., New York, N. Y., 1975. p 293-324. 1 fig, 4 tab, 102 ref.

Descriptors: *Analytical techniques, *Chromatography, *Soils, *Distillation, Pesticide residues, Humus, Separation techniques, Fulvic acids, Humic acids, Colloids, Carbohydrates, Organophosphorus pesticides, Chlorinated hydrocarbon, Triazine pesticides, *Pollutant identification.
Identifiers: *Liquid chromatography, Gel filtration, Waxy components.

The limited applications of liquid chromatography (LC) to soils stems largely from the poor resolution that can be achieved by this method and to the fact that no satisfactory detection systems for the column eluent have so far been devised. Informa-

tion on soil sampling and techniques used are reviewed. Since the major use of LC is as a cleanup technique, separation of interferences and concentration techniques as related to humic and fulvic acids, centering on Sephadex gel filtration columns (to provide a fractionation based on molecular weight) is discussed. Phosphorus compounds in soils are most often fractionated by paper or anion-exchange chromatographic methods but column chromatographic methods have been used occasionally in conjunction to separate organic phosphorus from excess salts prior to quantitative estimation of ribonucleic acid phosphorus by anion-exchange chromatography. Hydrolyzates of soil extracts containing carbohydrates have been purified and fractionated by a variety of LC procedures, as applicable to results required. LC is particularly well suited for cleanup of highly pesticide contaminated materials, such as soil extracts and it has been used extensively for cleanup of biological and soil extracts containing organochlorine and organophosphorus insecticides and herbicides. Trade and chemical names of the pesticides discussed and systems used are given. (Auen-Wisconsin)

PAPER CHROMATOGRAPHIC ANALYSIS IN AIR POLLUTION,
Wisconsin Univ., Madison. Water Resources Center.
G. Chesters, and D. A. Graetz.
In: 'Chromatographic Analysis of the Environment,' Robert L. Grob, editor. Marcel Dekker, Inc., New York, N.Y., 1975, p 179-192. 62 ref.

Descriptors: *Analytical techniques, *Chromatography, *Air pollution, Aromatic compounds, Organic compounds, Alcohols, Phenols, *Pollutant identification.
Identifiers: *Paper chromotography, Polynuclear aromatic hydrocarbons, Carbonyl compounds.

Paper chromatography (PC) has not been applied extensively to air pollutants; the majority of the literature deals with the separation and identification of polynuclear aromatic hydrocarbons. Specific sampling techniques and the sensitivity of particular methods are discussed. Organic contaminants are among the major components of atmospheric pollution and the polynuclear aromatic hydrocarbons have been of greatest concern because several display carcinogenic properties. Acetylated PC has also been used in analyzing polynuclear aromatic hydrocarbons in tobacco smoke, automobile exhausts, and polluted air with excellent resolution of closely related compounds. PC has been used for the separation and identification of the 2,4-dinitrophynylhydrazones of aldehydes and ketones; by quantitative conversion of carbonyls to their 2,4-dinitrophynylhydrazone derivatives, satisfactory separation of carbonyl compounds in air, cigarette smoke and car exhaust samples can be achieved. PC for separating volatile aliphatic alcohols as their 3,5-dinitrobenzoate derivatives is described. Aliphatic amines have been identified by gas chromatography as to their benzamides with excellent resolution. For qualitative analysis and for purification of samples the PC technique has proved useful but because of the low carrying capacity of paper, the method is restricted as a quantitative technique. (Auen-Wisconsin)

PAPER CHROMATOGRAPHIC ANALYSIS IN SOIL CHEMISTRY,
Wisconsin Univ., Madison. Water Resources Center.
G. Chesters, and D. A. Graetz.
In: 'Chromatographic Analysis of the Environment,' Rober L. Grob, editor. Marcel Dekker, Inc., New York, N.Y., 1975, p 325-375. 4 tab, 311 ref.

Descriptors: *Analytical techniques, *Chromatography, *Soils, Humus, Carbohydrates, Amino acids, Pesticides, Inorganic compounds, Chlorinated hydrocarbon, Organophosphorus pesticides, Insecticides, Herbicides, *Pollutant identification.
Identifiers: *Paper chromatography.

For analyses of indigenous soil components perhaps the most extensive qualitative use of paper chromatography (PC) is for determination of amino acids, but this form of analysis has been superceded largely by column ion-exchange chromatography. For pesticide analyses of soil and sediment extracts, paper chromatography serves for cleanup of samples prior to determination by some other analytical method; semiqualitative determination of pesticides in soil and sediment extracts; indentification of intact pesticides, and identification of unknown metabolites and other pesticide degradation products; and screening tests for possible pesticidal contamination of soils and sediments. However, the method possesses the disadvantage of being too tedius and time consuming for routine analysis and gas chromatography has proved to be more efficient. PC still possesses utility for separating multiple-component systems and for identifying unknown components, particularly when it is implemented by other methods. In the determination of inorganic compounds in soils, developments in PC methodology continue to be made; however, widespread environmental use of this tehcnique for determining toxic elements is unlikely, particularly for those metal ions capable of forming volatile coordination complexes. The methods and uses of PC analysis in humic materials and their degradation products, carbohydrates, organic phosphates, amino acids, pesticides, and inorganic components are described. ELECTROCHEMICAL DETECTION OF NH4 PLUS NH3 SYSTEMS IN WATER,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
J. Barica.
American Society for Testing and Materials, Special Technical Publication 573, p 20-24, 1975, 1 fig, 6 ref.

Descriptors: *Ammonia, *Analytical techniques, *Electrodes, Measurement, *Pollutant identification, *Electrochemistry, Water analysis, Chemical analysis.

Ammonia determination by conventional colorimetric methods or distillation normally yields total ammonia concentration in water samples. It is however, the unionized free ammonia that exerts adverse physiological or histopathological effects on fish as the threshold lethal concentration-50 is 0.2 mg/l ammonia. Free unionized ammonia concentrations depend on sample pH and temperature and can be calculated from ionization constants for different temperatures. Total, ionized, and unionized ammonia can be directly measured as ammonium ion with a univalent (monovalent) cation electrode; unionized free ammonia using a membrane-type ammonia electrode (ammonia probe); and total ammonia using a membrane-type ammonia electrode after converting ammonium ion to ammonia by alkalization of the sample to about pH 12. Specific ion electrodes are not as accurate as spectrophotometric ammonia determinations below 1 mg/l, but at higher concentrations they do not require sample dilution, are faster, and the sample volume is minimal. Continuous monitoring and signaling of dangerous ammonia levels would be possible. Glass electrodes are less expensive, specific, versatile, and faster than ammonia probes but are limites to waters with low, constant potassium and sodium ion background. Both electrodes can be used simultaneously in the same or a continuous sample, since no pretreatment is needed. (Buchanan-Davidson--Wisconsin)

Descriptors: *Waste water treatment, *Industri wastes, *Pulp and paper industry, Analytic techniques, Pollutant identification, Sulfi liquors.
Identifiers: *Potentiometric titration.

Current regulations on water and air polluti abatement necessitate the development of acc rate and rapid analytical techniques for estimati treatment requirements for discharged pollutan Potentiometric titration curves were obtained f two polysulfide and four sulfate black liquo Potentiometric titration of mercaptan fortifi sulfate black liquors produced three inflecti points. The first potential drop was due monosulfide, the second was due to ganic/inorganic polysulfide (bound mercapta and the third to ionized free mercaptan. Most the mercaptide ion in normal mill run black liq is bound by traces of elemental sulfur to form gano-polysulfide which contributes to the pot tiometric titration. This increases the difficulty volved in the determination of methyl mercap by potentiometric titration. Correct interpretati of the titration curves is critical to the success sulfide analysis of black liquors. Thiolignin had measurable effect on the results of potentiome titration of sulfides in black liquors. The par abatement of air pollution from the sulfate pulp process can be achieved by periodically adding excess of elemental sulfur to keep the ratio of mental sulfur to mercaptide sulfur greater than throughout the cooking stage. romatic hydrocarbons are known to be common
nvironmental pollutants. It is usually difficult if
ot impossible to establish the origin of these
ydrocarbons. Their source may be spills of fossil
uels or fallout of incompletely combusted organic material, or wastes from trade and industry. Analytical methods for detecting aromatic hydrocarbons are outlined. A detailed discussion is presented on a method based on a combined system of gas chromatography and mass spectrometry. The data handling for this technique is performed by an on-line coupled computer. Domestic sewage, diesel fuel, and sediment recently contaminated by oil were analyzed by this method. An extensive characterization of the aromatic hydrocarbon mixtures in sewage and sediment samples permits the identification of their origin. (Orr-FIRL)

Identifiers: *Photochemical oxidation, Organic carbon, Oxidation rates.

Dissolved organic carbon may be determined by a new method presented. Organic carbon compounds are oxidized at 40 C by means of ultraviolet radiation. The radiation source is a special low-pressure mercury lamp, which is submerged in the reactor. The instrument is sensitive enough to detect 0.001 mg of dissolved organic carbon in one liter of water. Each analysis provides a characterization of the particular organic material of the sample, because of the different rates of oxidation of various organic substances. (Kramer-FIRL)

Descriptors: *Mercury, *Salinity, *Organic matter, Fresh water, *Estuarine environment, Mississippi River, Florida, Dissolved solids, Analytical techniques, *Pollutant identification.
Identifiers: Fulvic matter, Organic carbon.

An investigation was made on the association of mercury with dissolved organic matter and the effect of salinity variations on the forms and transport of dissolved mercury from fresh water to marine environments. Samples of estuarine environments were taken from the Mississippi Delta and from the Florida Everglades. It was found that dissolved mercury in estuarine waters from these two areas is associated with dissolved organic matter which has the properties of fulvic matter found in soils. The role of methylmercury in the transport of dissolved mercury was insignificant in these estuarine streams. In the Mississippi River, most of the dissolved mercury and most of the dissolved organic carbon existed in the less than 500 molecular size cut-off fraction. Molecular size distribution for both organic carbon and mercury showed very little change across the salinity gradient. The Everglades waters, with a very high dissolved organic carbon content, may be partially regulated for dissolved mercury by coprecipitation with large organic molecules. From both observed and experimental evidence, it was indicated that mercury is not readily exchangeable from dissolved organic matter in the transition from fresh water to sea water. (Kramer-FIRL)

EVALUATION OF A SINGLE-STEP BACTERIAL POLLUTION MONITOR,
Millipore Corp., Bedford, Mass.
R. A. Cotton, K. L. Sladek, and B. I. Sohn.
Journal of the American Water Works Association, Vol 67, No 8, p 449-451, August, 1975. 4 fig, 3 tab, 6 ref.

Descriptors: *Membranes, *Filters, Water pollution, Statistical analysis, Bacteria, Monitoring, Sampling, Coliforms, *Pollutant identification.
Identifiers: *Bacterial pollution monitor, Millipore filters, Total-bacteria.

A single step bacterial pollution monitor is discussed and evaluated. This monitor is a self contained filtration unit, nutrient supply and incubation chamber, and, when immersed in water, samples a one ml aliquot. This was compared with standard membrane and filter techniques. Results with the new sampler compared favorably and were within statistical error of the standard tests. Statistical variations can be caused by the inherent randomness of sampling and by the variability of the test itself. This method of bacteriological testing can be useful when a simple, quick, and accurate test method is required. (Pinto-FIRL)

USE OF TEST WELLS AS WATER-QUALITY PREDICTIONS,
Wisconsin Univ., Oshkosh. Dept. of Geology.
C. W. Fetter, Jr.
Journal of the American Water Works Association, Vol 67, No 9, p 516-518, September, 1975. 8 fig, 1 tab.

Descriptors: *Test wells, *Water quality, Drilling, Groundwater, Water wells, Well casings, Well screens, Casings, Grouting, Water pollution, Chemical analysis, Sodium, Chloride, Iron, Alkalinity, Specific conductivity, Pollutant identification.
Identifiers: *Water quality predictors, Long Island(NY).

Groundwater quality can vary from good to unacceptable over certain areas. The use of test wells as water quality predictors was studied. They can be especially useful in cased wells, where the majority of the expense lies in casing, the well screen, the gravel pack, the grouting, and the development. A test well, expensive as it may be, will be less expensive than the purification process that must be used on contaminated water. Another advantage is that the casing and screen for the test well can be used again in other test wells. The test wells discussed were built in Suffolk County on Long Island, where the groundwater can have large variations. The first stage in building a test well is drilling a test boring, either 12 in or 20 in in diameter. Core samples are taken and analyzed by a geologist every 10 or 20 feet. From the samples, the geologist will decide which zones or levels are suitable for testing. The hole is backfilled for the testing to take place. A complete chemical analysis is made on a sample of water taken from the well. Samples are analyzed for sodium, chloride, iron, hardness, alkalinity, and specific conductivity. In the eight test wells drilled on Long Island, the correlation with the permanent wells were excellent. Specific conductivity tended to be slightly higher in the permanent well than in the test well, as were concentrations of chloride, sodium, hardness and alkalinity, with very few exceptions. Iron tended to be less concentrated in the permanent well than in the test well. (Pinto-FIRL)

TRACE METALS IN MELBOURNE RIVERS-AN INTERLABORATORY ANALYSIS,
Materials Research Labs., Ascot Vale (Australia).
A. T. Phillip, R. W. Pettis, J. E. Harris, G. J. Fabris, and P. L. Boar.
Proceedings of the Royal Australian Chemical Institute, Vol 42, No 8, p 209-215, August, 1975. 1 fig, 5 tab.

Descriptors: *Analytical techniques, *Heavy metals, *Pollutant identification, Estuaries, Oceans, Rivers, Sampling, Laboratory tests, Copper, Lead, Cadmium, Toxicity.

Analytical techniques and procedures utilized in the study of trace metals in river estuarine and oceanic waters are reviewed. Three independent Melbourne (Australia) laboratories conducted the experiments. Copper, lead and cadmium were the selected trace metals because of their high toxicity to a large variety of aquatic and marine biota. River water samples were taken from the surface of the Yarra and Maribyrnong Rivers at three stations. Two sets of water samples were made at a fourteen day interval. The first set of samples was put directly into the receptacles without acid addition. Two of the laboratories determined total metal content while the third one determined the dissolved-metal content. The second set was immediately acidified when collected. All three laboratories determined total metal content. Experimental procedures are described. The overall mean concentrations found were: copper 6.9+ 1.5 microgram/liter, lead 5.4 +1.5 microgram/liter, and cadmium less than 0.5 microgram/liter. The results are comparatively similar to those found in various other streams in different parts of the world. These concentrations of the metals are considered to be below the safety level although they may be toxic to the more sensitive aquatic species. Further interlaboratory work is encouraged in order to establish accurate analytical procedures for trace metals and to further calibrate interlaboratory studies. (Waltner-FIRL)

Identifiers: Sample freezing, Waste water samples, Acidification.

A summary is presented of sample preservation techniques for the major parameters of waste water, including BOD, COD, suspended solids, nitrates, nitrites, total nitrogen, ammonia, phenols, and phosphorus. The techniques are applicable in cases when waste water samples cannot be immediately analyzed. Because changes taking place in the samples are either biological or chemical, preservation serves to retard biological action, to inhibit precipitation and hydrolysis of chemical compounds, or to retard the volatility of various constituents. The physical methods commonly used are refrigeration or freezing. Several chemical methods are applicable, these are usually dependent upon the addition of metalbolism suppresents. Tables are presented for each of the major waste water parameters, with a brief discussion and recommendation for each. For BOD, freezing or refrigeration is recommended, and values will tend to be low. For COD, acidifcation with sulfuric acid or freezing is suggested. Suspended solids are not preserved well and immediate analysis is the best alternative. Preservation of nitrates may be accomplished by refrigeration plus sulfuric acid. Ammonia may be preserved by refrigeration plus the addition of not more than 40 mg/liter mercuric chloride. Nitrites, however, should be analyzed immediately. For phenols, the addition of one g/liter copper sulfate, and acidification to pH 2 to 2.5, followed by storage in glass bottles with immediate refrigeration is recommended. Phosphates may be preserved by acidification plus refrigeration, while total phosphorus is best kept by acidification and freezing. (Kramer-FIRL)

WATER QUALITY STUDIES AND LAND-USE MAPPING USING ERTS-1 DATA,
Lund Univ. (Sweden). Dept. of Geography.
U. Hellden, and H-A. Olsson.
Journal of the British Interplanetary Society, Vol 28, No 9/10, September/October, 1975. 9 fig, 15 ref.

Descriptors: *Satellites(Artificial), *Monitoring, *Land use, *Pollutant identification, Oil spills, Lakes, Industrial wastes, Eutrophication, Sewerage, Water pollution sources.
Identifiers: LANDSAT, Sweden.

The use of ERTS-1 data for water quality studies and land-use mapping is discussed. In this application, sewage conditions of Copenhagen in the Oresund and 161 lakes in South and Middle Sweden were investigated. The effects of waste disposal from sewers on lake and Middle Sweden were investigated. The effects of waste disposal from sewers on lake eutrophication may be o served by satellite MSS images. Industrial pol tion was also observed, including the discovery a belt of oil pollution in the southern part of t Baltic. Circulation of polluted water due to m nicipal and industrial wastes was followed variation in reflectivity of a great number of lakes was found, and significant regional d ferences were compared. Correlations betwe the satellite spectrophotometry measurements a in situ turbidity and transparency data were q good. The MSS images of chlorophy (containing algae and plankton) water reflec most intensively within the band 0.4 to micrometers and industrial water pollut reached highest reflection in the band 0.6 to micrometers. It was thus shown that the chann most suitable for water quality detection ERTS-1 MSS4 and MSS5. From the imagery d gathered, a detailed differentiation of land use the coastal area of Sweden was prepa (Kramer-FIRL)

OIL/WATER TANK CONTENT PROFILES,
Exxon Research and Engineering Co., Flor Park, N.J.
R. J. Skocypec.
Available from the National Technical Infor tion Service, Springfield, Va 22161, as COM 10540, $6.00 in paper copy, $2.25 in microfi Report EE.30TMR.71, December 1971. 127 p fig, 9 tab, 3 append. Department of Commerc 1-35049.

Descriptors: *Water pollution, *Oil pollut *Oily water, Ships, Profiles, Measurement, S pling, Oil wastes, Oil industry, Oil-water interf Oil.
Identifiers: *Ballast tanks, Oil tankers.

Static oil content profile data was compiled ballast tanks aboard Esso tankers in dirty ser Dirty ballast tanks were found to contain a tively clean bulk water phase with a surfac layer of a few inches in thickness and an incre oil content near the botton of the tank about of the time. The mean bulk oil contents of al dirty ballast profiles showed a log-normal pr bility distribution with mean oil content of 18 as both free and dissolved oil. Clean ballast t were found to be extremely clean with 50% o profiles showing mean oil contents below 3 No obvious correlation between oil content tank cleaning time could be detected. Little than a sheen was usually detected at the sur Slop tank profiles showed widely spread ranging from a low of 30 ppm to high of 500 oil. There was no apparent reason for phenomenon and further investigation of tanks was recommended. Oil layer thickn were on the order of several feet. (Sims-ISWS W76-01837

FEASIBILITY OF REMOTE SENSING FOR TECTING THERMAL POLLUTION--PAR FEASIBILITY STUDY; PART II: IMPLEM TATION PLAN,
Miami Univ. Coral Gables, Fa. Dept. of Mec cal and Industrial Engineering.

ity, Turbidity, Measurement, Instrumenta- Equipment, Pollutant identification, Satel- Artificial), Aircraft, Water pollution, Path of tants, Water cooling, Thermal powerplants, ematical models, Model studies.

problems associated with thermal pollution ompounded by recent trends of building more larger nuclear power plants in order to meet rowing energy demand. The first part of the rt, covering the feasibility study, indicated (1) using passive remote sensing methods, y it is possible to detect water surface tem- tures within plus and minus one degree with a ution of 0.3 mile radius from spacecraft; (2) active remote sensing methods, techniques instruments could be developed for remote ing of vertical temperature and turbidity dis- tions in oceans; and (3) it is feasible to lop a generalized three-dimensional model to ict the motion, temperature, and salinity of mal plumes within waters to which they are harged. The second part of the report, cover- the implementation plans, included: (1) the lopment and testing of a universal analytical el to predict three-dimensional temperature salinity distributions in coastal regions receiv- hot discharges, (2) improving the accuracy of thermal remote sensing systems, and (3) the lopment and testing of an active remote ing system to measure the water tubidity. s-ISWS)

e potential for obtaining information concerning tain water quality variables on a stream by con- ering the relationships which exist between lity and quantity variables was examined. re precisely, the study was concerned with the ationship which exists between discharge and rganic water quality in natural streams. Inor- ic water quality was taken to refer to the con- trations of inorganic constituents found dis- ved in the stream water. Natural streams were fined as those streams which are free of man's luence, although some compromise of this finition was necessary in actual application. The ationship studied was the negative correlation tween inorganic water quality and discharge ich is found in virtually all streams. Study was ited to 13 inorganic constituents. A relationship tween constituent concentrations and conduc- ity based on chemical theory was developed and applicable to any stream sample. Applications re made using data from five streams.
